

ADJUSTMENTS, TESTS AND MAINTENANCE OF **D.C. GENERATORS**

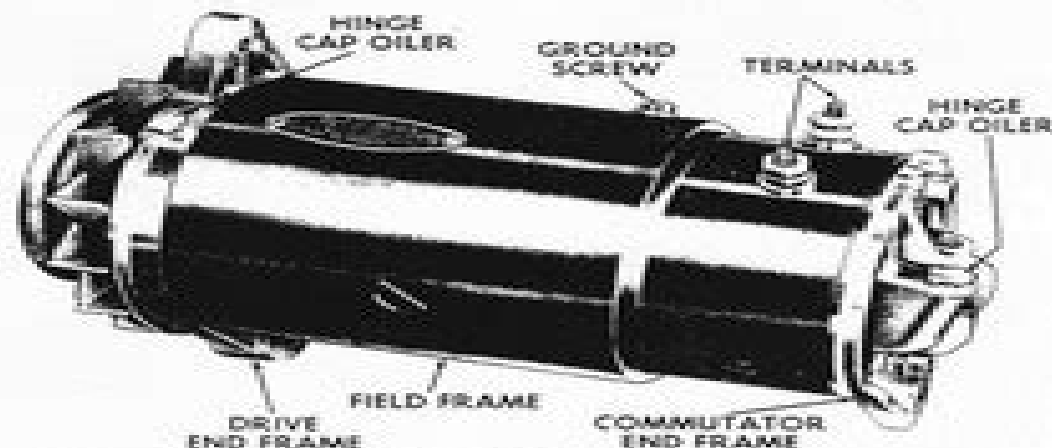

Figure 1—Typical D.C. Generator.

INTRODUCTION

Delco-Remy d.c. generators are manufactured in a wide range of sizes and types, but the basic design of each generator is the same. Regardless of size, each generator has an armature mounted at both ends on bearings. The armature rotates between pole shoes over which are wound field coils. The voltage and current developed in the armature windings is supplied through brushes riding on a commutator to the generator terminals, and then to the battery and other electrical accessories in the circuit. Since all d.c. generators adhere to the same basic design, the maintenance and testing procedures for all sizes are similar. A typical generator is shown in Figure 1.

This bulletin covers the different types and designs of d.c. generators along with recommended service procedures for each. The subject of Operating Principles is covered in Delco-Remy Training Chart Manual DR-5538E.

TYPES AND DESIGNS

The following cross sectional views illustrate the various types of generators manufactured by Delco-Remy.

The extruded frame two-brush, two-pole type of generator shown in Figure 2 has a frame diameter size of 4 1/4 inches. Each end frame has hinge cap oilers for periodic lubrication, and the commutator end frame features a bronze bushing and an oil reservoir. Continuous lubrication to the bushing and shaft is provided by a wick which extends through a hole in the bushing to contact the shaft. A special version in the 4 1/4 inch frame diameter size is the generator shown in Figure 3. This assembly features a blast tube for forced air cooling, and sealed ball bearings in each end frame which are lubricated for the life of the bearing.

The generator shown in Figure 4 has a frame diameter size of 5 1/4 inches. It features ball bearings
