Production of Biofuels and Numerical Modeling of Chemical Combustion Systems Miguel Torres García, Juan Francisco García Martín, 2021-08-18 Biofuels have recently attracted a lot of attention mainly as alternative fuels for applications in energy generation and transportation The utilization of biofuels in such controlled combustion processes has the great

advantage of not depleting the limited resources of fossil fuels while leading to emissions of greenhouse gases and smoke particles similar to those of fossil fuels. On the other hand, a vast amount of biofuels are subjected to combustion in small scale processes such as for heating and cooking in residential dwellings as well as in agricultural operations such as crop residue removal and land clearing. In addition, large amounts of biomass are consumed annually during forest and savanna fires in many parts of the world. These types of burning processes are typically uncontrolled and unregulated. Consequently, the emissions from these processes may be larger compared to industrial type operations. Aside from direct effects on human health, especially due to a sizeable fraction of the smoke emissions remaining inside residential homes, the smoke particles and gases released from uncontrolled biofuel combustion impose significant effects on the regional and global climate. Estimates have shown the majority of carbonaceous airborne particulate matter to be derived from the combustion of biofuels and biomass. *Production of Biofuels and Numerical Modelling of Chemical Combustion Systems* comprehensively overviews and includes in depth technical research papers addressing recent progress in biofuel production and combustion processes. To be specific, this book contains sixteen high quality studies, fifteen research papers and one review paper addressing techniques and methods for bioenergy and biofuel production as well as challenges in the broad area of process modelling and control in combustion processes.

A Laboratory Manual of Analytical Methods of Protein Chemistry P. Alexander, H. P. Lundgren, 2014-05-17. *A Laboratory Manual of Analytical Methods of Protein Chemistry* Volume 5 presents the laboratory techniques for protein and polypeptide study. This book discusses the staining procedure for histones which has a high degree of selectivity for basic proteins and the unique ability to visualize qualitative differences in terms of color changes. Organized into four chapters, this volume begins with an overview of the formalin mediated ammoniacal silver staining procedure as a selective stain for basic proteins and its application per cell and per extract. This text then examines the optical rotatory dispersion (ORD) which has advanced into a powerful tool for describing the conformations and conformational changes of biopolymers. Other chapters consider the application of ultrasensitive calorimetry to thermodynamic problems. This book discusses as well the principle of the technique, its instrumentation and experimental procedures. The final chapter deals with the hydrodynamic densities and preferential hydration values for protein precipitates in concentrated salt solutions. This book is a valuable resource for chemists and biochemists.

Moody's International Manual, 1996. *Mergent International Manual*, 2009. **Method Development in Analytical HPLC** Serban C.

describes the development of original methods with selection of the suitable type of HPLC of specific columns mobile phase and detection techniques with an emphasis on the use of mass spectrometry for detection as well as optimization and validation of the chosen analytical method The book includes useful details on method development for specific types of chromatography such as RP HPLC HILIC ion exchange size exclusion and chiral Method Development in Analytical HPLC also includes information about green chemistry in analytical methods computer assisted method development and other key contemporary aspects of the subject Offers a systematic and logical presentation of the foundational of analytical HPLC Goes in depth on method development for specific types of chromatography such as RP HPLC HILIC ion exchange and size exclusion Includes methods with an emphasis on the use of mass spectrometry for detection

Biocontrol Agents and Natural Compounds against Mycotoxinogenic Fungi Florence Mathieu, Selma P. Snini, 2020-11-25 Mycotoxins are toxic secondary metabolites produced by fungi They cause deleterious effects on humans animals and plants More than one hundred mycotoxins are known which contaminate food and feed raw materials Fungal infection and mycotoxin contamination can occur directly in fields pre harvest stage during storage or during industrial processing post harvest stage Given the proven toxicity of mycotoxins and their widespread distribution it is necessary to prevent their occurrence in food and feed To limit mycotoxin contamination several techniques can be adopted at the pre harvest or post harvest stages These techniques can reduce mycotoxin concentration through fungal growth reduction or mechanisms leading to mycotoxin degradation or mycotoxin detoxification i e reduction of the toxicity Until very recently fungicides were favored to limit mycotoxin contamination by reducing fungal growth Nonetheless the sanitary and environmental impacts of these products and their effects on food quality encourage the development of alternative strategies based on biocontrol agents BCAs or natural compounds Moreover in some cases fungal growth reduction can stimulate mycotoxin production The focus of this Special Issue of Toxins is to gather the most recent advances related to reducing mycotoxin contamination in food and feed using BCAs and natural compounds In this context two main types of approaches can be proposed Preventive methods that could be applied in the field during storage or during industrial processing and curative methods that detoxify contaminated matrices by eliminating the produced mycotoxin
