Quantitative Aspects of Growth and Metabolism of Microorganisms A.H. Stouthamer, 2012-12-06 Application of recent advances such as non equilibrium thermodynamics the maintenance concept and the material balancing method to the description of microbial growth has suggested new experimental approaches which have yielded a wealth of data These data have been used to develop mathematical models of microbial growth and metabolism and the models have made it possible to direct the metabolism of a microorganism in such a way that more of a certain desired product is made While a full quantitative description of all aspects of microbial growth and metabolism is still remote the new approaches are opening up large areas of new potential it is now possible for instance to deal with individual cells in a population and with quantitative aspects of product formation and optimisation Microbiologists biochemists and physiologists will find this an invaluable update on a field of great promise

Environmental Stressors and Gene Responses J.M. Storey, K.B. Storey, 2000-07-31 Cell and Molecular Responses to Stress is a new multi volume book series from Elsevier Science that focuses on how organisms respond at a molecular level to environmental stresses imposed upon them All organisms deal with variations in multiple environmental factors including temperature oxygen salinity and water availability Many show amazing tolerances to extreme stress with remarkable biochemical adaptations that allow life to persist under very difficult circumstances This series explores the molecular mechanisms by which cells and organisms respond to stress focusing on the variations in metabolic response that allow some cells and organisms to deal with extreme stress others to endure stress within strict limits and others to have a very low tolerance for changes in environmental parameters Articles from within the series highlight the elastic limits of molecular responses in Nature with examples drawn from animal plant and bacteria systems Volume 1 begins by considering some of the roles of environmental stress in determining the geographic distribution of animals and in promoting species divergence and then explores gene expression and metabolic responses to environmental stress with examples of adaptation to high and low temperature osmotic anoxia ischemia desiccation high pressure and heavy metal stresses
