

A Simple Guide to Oil Refining

We all know that motor oil and gasoline come from crude oil. What many people do not realize is that crude oil is also the starting point for many diverse products such as clothes, medical equipment, electronics, vitamin capsules and tires.

Whether on land or under the ocean, crude oil comes from deep underground where the remains of plants and animals from millions of years ago have been heated and pressurized over time. Generally blackish in color, crude oil has a characteristic odor that comes from the presence of small quantities of chemical compounds containing sulfur and nitrogen. There are different grades of crude oil. Each grade has a specific composition that is determined by the original decomposed source materials as well as the properties of the surrounding soil or rock formations. It can be light or heavy, referring to density, and sweet or sour, referring to its sulfur content. However, in its raw state, crude oil is of little use. It must be refined to make it into useable products. Depending on the type of crude oil, it is treated via different refining processes to turn it into fuels, lubricating oils, waxes, chemicals, plastics and many other products used everyday in modern society.

The Refining Process

Once discovered, drilled and brought to the earth's surface, crude oil is transported to a refinery by pipeline, ship or both. At the refinery, it is treated and converted into consumer and industrial products.

Three major refinery processes change crude oil into finished products:

- Separation,
- Conversion, and
- Purification.
