

Plant Form & Structure

Leaf Structure & Function

Cuticle - protective layer covering on plant surface that prevents water loss

Stoma - opening on the surface of leaf, allow the exchange of CO_2 and O_2

Epidermis - the outermost layer of cells covering the stem, root, leaf, flower, fruit, and seed part of a plant

Mesophyll - ground tissue between upper/lower epidermis

Palisade layer - sites of photosynthesis

Root Structure & Function

Xylem - carries absorbed water and minerals in one direction from the roots to the stems and leaves

Phloem - carries organic compounds, such as carbohydrates, and some hormones composited in one direction

- water and minerals
- no end walls between cells
- one-way only
- outer cells are not living

Xylem

Phloem

- organic molecules
- end walls (sieve plates)
- two-way movement
- cells are living but need support

Reproductive Structures

Gametophyte (n) - stage which produces haploid sex cells in plants and algae

Spore (2n) - fusion of gametes has occurred: zygote will grow using mitosis to become adult. Will mature and produce sex cells (n) to be released.

Transport Phenomena in Plants D. A. Baker,2012-12-06 Plants in addition to their role as primary synthesizers of organic compounds have evolved as selective accumulators of inorganic nutrients from the earth s crust This ability to mine the physical environment is restricted to green plants and some microorganisms other life forms being directly or indirectly dependent on this process for their supply of mineral nutrients The initial accumulation of ions by plants is of ten spatially separated from the photosynthetic parts necessitating the transport to these parts of the inorganic solutes thus acquired The requirement for energy rich materials by the accumulation process is provided by a transport in the opposite direction of organic solutes from the photosynthetic areas These transport phenomena in plants have been studied at the cellular level the tissue level and the whole plant level The basic problems of analysing the driving forces and the supply of energy for solute transport remain the same for all systems but the method of approach and the type of results obtained vary widely with the experimental material employed reflecting the variation of the solute transporting properties which have selectively evolved in response to both internal and external environmental pressures
