

Kingdom Fungi Study Guide

Fungi are a diverse group of organisms. They have some characteristics that are similar to protists, and some characteristics that are similar to plants. For the most part, the majority of fungi are **heterotrophic eukaryotes**. They have cells walls that are made of a substance called **chitin**. Fungi usually release enzymes of their food which allows them to absorb nutrients. They usually use **hyphae** (the fibers that make up most fungi) to absorb the nutrients from the organisms they are consuming. Fungi are essential to ecosystems as they help to break down dead or decaying organisms and return nutrients back to the Earth. They are the great **recyclers** of ecosystems. Other fungi are not as helpful. These fungi live off of other organisms as **parasites**. Most fungi are more of a nuisance to their host than a true detriment.

There are four main groupings of fungus: **Ascomycota** (sac fungus), **Basidiomycota** (club fungi), **Zygomycota** (common mold) and **Deuteromycota** (imperfect). The most commonly recognized fungi belong to **Basidiomycota**. These are the button type mushrooms that appear in grocery stores or on your front lawn. Ascomycota often look like cups or little sacs. You might find them attached to a tree. **Zygomycota** are found on breads or can be household mold. Finally, **Deuteromycota** include fungi that cannot be classified anywhere else.
