

7.4 Homeostasis and Cells

Lesson Objectives

-  Explain how unicellular organisms maintain homeostasis.
-  Explain how multicellular organisms maintain homeostasis.

Lesson Summary

The Cell as an Organism Sometimes a single cell is an organism. Single-celled organisms must be able to carry out all the functions necessary for life.

- ▶ Unicellular organisms maintain **homeostasis**, relatively constant internal conditions, by growing, responding to the environment, transforming energy, and reproducing.
- ▶ Unicellular organisms include both prokaryotes and eukaryotes.
- ▶ Unicellular organisms play many important roles in their environments.

Multicellular Life Cells of multicellular organisms are interdependent and specialized.

- ▶ The cells of multicellular organisms become specialized for particular tasks and communicate with one another to maintain homeostasis.
- ▶ Specialized cells in multicellular organisms are organized into groups.
 - A **tissue** is a group of similar cells that performs a particular function.
 - An **organ** is a group of tissues working together to perform an essential task.
 - An **organ system** is a group of organs that work together to perform a specific function.
- ▶ The cells of multicellular organisms communicate with one another by means of chemical signals that are passed from one cell to another.
 - Certain cells form connections, or **cellular junctions**, to neighboring cells. Some of these junctions hold cells together firmly.
 - Other cells allow small molecules carrying chemical signals to pass directly from one cell to the next.
 - To respond to a chemical signal, a cell must have a **receptor** to which the signaling molecule can bind.

The Cell as an Organism

For Questions 1–5, complete each statement by writing the correct word or words.

1. The term _____ refers to the relatively constant internal physical and chemical state of a living cell.
2. Unicellular prokaryotes, called _____, are adapted to living in a remarkable number of different places.
3. Some unicellular eukaryotes, called _____, contain chloroplasts.
4. Yeasts are unicellular _____, which are eukaryotes.
5. Other unicellular eukaryotes include _____ and algae.

Plant Responses to Salt Stress Keni Cota-Ruiz, Zulfiqar Ali Sahito, Adalberto Benavides-Mendoza, 2024-09-13 Feeding the growing world population will require a significant increase in agricultural production However food overproduction needs to be achieved while crops and plants face salinized soils water deficits lesser arable lands drought and climate change among other factors Salinity impairs plant functioning at multiple levels For instance excess salt contents cause higher osmotic pressures nutritional disorders seed germination inhibition and growth suppression Plants respond to this aggression by activating several metabolic pathways including but not limited to regulating hormone dependent processes repressing growth related genes and eliciting the antioxidant response system Worldwide lands under irrigation practices are experiencing higher salt content impacting plant performance and causing significant drops in yields Therefore understanding how cultivars and plants respond to adverse environments such as salt excess in soils as well as investigating novel approaches to boost stressed plant physiological performance are vital components that need to be addressed if we are to achieve food security Multiple genes involved in the ABA signaling pathways are known to respond and start plant

adaptive responses when facing salt stress In addition several transcription factors such as the phytochromes and zinc finger proteins play roles in regulating the morphological responses of plants under stress Antioxidant enzymes are also upregulated in response to higher content of salt Recently nanobiotechnological approaches aimed at delivering cargoes such as micronutrients or chemicals in a cell specific manner are a promising alternative to aid plants in combating stress Similarly using nanofertilizers shows favorable effects in plants under hostile environments CRISPR CAS is an emerging powerful and feasible tool to modify genes and be applied to plants to make them more tolerant to salt in excess
