Konyukhov, Karl Schweizerhof, 2012-08-14 This book contains a systematical analysis of geometrical situations leading to contact pairs point to surface surface to surface point to curve curve to curve and curve to surface Each contact pair is inherited with a special coordinate system based on its geometrical properties such as a Gaussian surface coordinate system or a Serret Frenet curve coordinate system The formulation in a covariant form allows in a straightforward fashion to consider various constitutive relations for a certain pair such as anisotropy for both frictional and structural parts Then standard methods well known in computational contact mechanics such as penalty Lagrange multiplier methods combination of both and others are formulated in these coordinate systems Such formulations require then the powerful apparatus of differential geometry of surfaces and curves as well as of convex analysis The final goals of such transformations are then ready for implementation numerical algorithms within the finite element method including any arbitrary discretization techniques such as high order and isogeometric finite elements which are most convenient for the considered geometrical situation The book proposes a consistent study of geometry and kinematics variational formulations constitutive relations for surfaces and discretization techniques for all considered geometrical pairs and contains the associated numerical analysis as well as some new analytical results in contact mechanics **Structural Science of Crystalline Polymers** Kohji

Tashiro, 2024-04-04 This book focuses on methods of how to understand the relationship between the structure and physical properties of polymers from the microscopic point of view on the basis of experimental and theoretical methodologies It is the second volume of a two volume set with Structural Science of Crystalline Polymers The first volume of the series Structural Science of Crystalline Polymers Basic Concepts and Practices describes the details of techniques for analysis of the hierarchical structure of crystalline polymers from both the experimental and theoretical points of view Readers of the first volume who master the concrete techniques and concepts necessary for the analysis of the structure of polymers are now invited to begin this second volume The methods introduced in this book are useful not only for understanding the

physical properties of crystalline regions but also for interpreting the bulk properties of polymer materials from the 3D structural point of view For this purpose a concrete description is provided so that readers can use the theory or the program in the actual interpretation of physical properties The physical properties of polymers are intimately related to the structural evolution in the crystallization process and also the structural changes in the samples subjected to an external field Concrete methods and examples are introduced for these studies making the book a useful and practical guide for young professional researchers including those working in industry At the same time it can also be used as an excellent reference for graduate level students
