Wilson, 2012-12-06 Great advances have been made in understanding hearing in recent years In particular the mechanical function of the cochlea has become the focus of intense interest This started in one direction with the discovery of otoacoustic emissions in 1978 which required active mechanical amplification processes as first postulated by Gold in 1948

Direct evidence for the role of this mechanism in sharpening up the otherwise poor basilar membrane tuning properties was provided in 1982 and in 1983 motility was shown in outer hair cells In parallel an immense amount of work has been done on the electrophysiology of hair cells following the first intracellular recordings in 1977 Over a longer time scale models of basilar membrane motion have been developed and refined and recently much effort has been put into incorporating active mechanisms and non linear processes It seemed an opportune time to bring together the leading workers in these various areas to take stock of the whole field and to stimulate further progress This book represents the proceedings of a NATO ARW on the Mechanics of Hearing held at the University of Keele 3 8 July 1988 The conception of the meeting owes much to earlier meetings held in Boston in 1985 Peripheral Auditory Mechallisms Eds J B Allen J L Basic Physics Karl F.
