

Transformation Geometry

Transformation of an object means that the object on the Cartesian plane *changes position, orientation and/or size*. The result is called the 'image' of the shape. To do any kind of transformation we use coordinates of different points on the original shape to find new coordinates for the transformed shape. Remember that our coordinate pairs are written like this:

$$(x ; y)$$

value on the x – axis   value on the y – axis

There are 4 basic types of transformations:

- 1) Translation – 'slide' to a new position
- 2) Reflection – 'mirror/fold' over a specific line
- 3) Rotation – 'turn' around a point
- 4) Enlargements & Reductions – similar (///) shape is made bigger or smaller in a certain ratio/*scale factor*

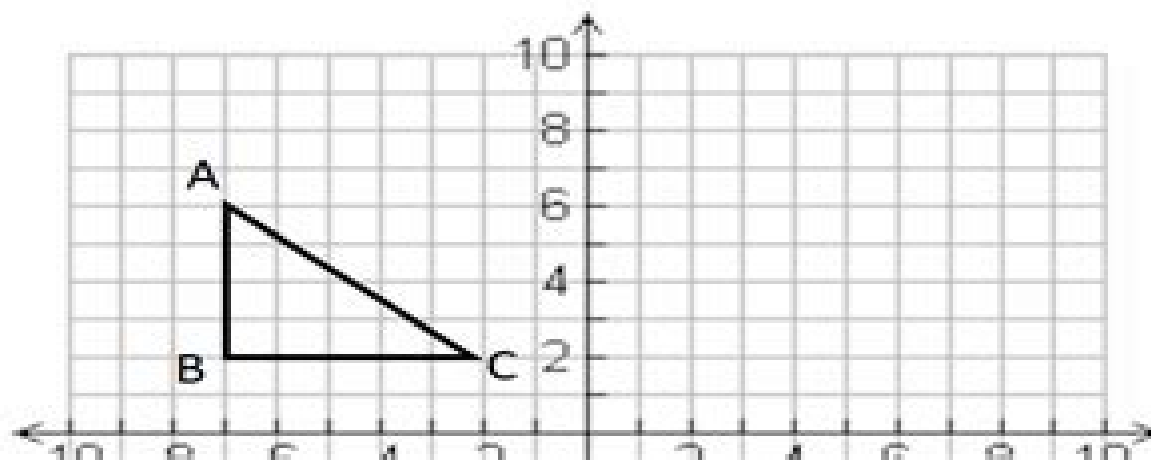

TRANSLATION

Every point on the shape is moved the same distance in the same direction. Size & shape don't change!

To describe a translation, both the *distance* & *direction* must be given.

Example: Draw the image of triangle ABC on the Cartesian plane if it is shifted 8 units to the right & 10 down.

We can write this translation like this: $(x : y) \rightarrow (x + 8 : y - 10)$. We can call our new image **$A'B'C'$**
