OBJECTIVE: How do water molecules move in and out of cells?

## Why?

Water accounts for over 70% of the human body. If water levels are not regulated and maintained in an organism the consequences can be disastrous. Cells and tissues may swell, blood cells burst, or the brain may expand so much it pushes on the skull, leading to brain damage and death. So what exactly is the process that allows organisms to regulate and maintain their water content?

## Model 1 – Movement of Water In and Out of Cells

1-A solution consists of solute and solvent mixed together. IDENTIFY the solute and solvent and their symbols in Model 1.

solute: \_\_\_\_\_ / \_\_\_\_\_

solvent: \_\_\_\_\_ / \_\_\_\_\_

2-CONSIDER the size of the sugar molecule and water molecule in Model 1. Which molecules are able to move through the cell membrane? \_\_\_\_\_

3-COUNT the molecules in model 1 and complete the table below.

|                           | Inside the Cell | Outside the Cell |
|---------------------------|-----------------|------------------|
| Number of sugar molecules |                 |                  |
| Number of water molecules |                 |                  |
| Ratio of water to sugar   |                 |                  |

4-DETERMINE which solutions are more concentrated in Model 1—inside or outside the cell.

EXPLAIN in terms of ratio of solute to solvent particles.

## **Transport In Cells Worksheet Answers Pogil:**

*Intracellular Transport* Katherine Brehme Warren, 2014-05-12 Intracellular Transport is a collection of papers that examines the processes of and the mechanisms underlying intracellular transport One paper describes that all active transport processes in the amoeba are intracellular and depend on dynamic transformations of membrane into cytoplasm and of cytoplasm into membrane Another paper discusses the kinetics of membrane transport of which the phenomena of counterflow can become a mobile carrier system The paper notes that the specific transport properties of membranes are conferred by the proteins of the surfaces that are grouped as macromolecular complexes probably similar to those of enzymes One paper describes the concept of parametric pumping an oscillation driven separation process as a possible model for active transport in biological cells Another paper compares the fine scale diffusion effects that happen in a mixture without large scale concentration gradients and where the effect are on a large scale The homogenous kinetic law can be used in the large scale situation the law already can account for any of the fine scale diffusion effects The paper notes that without large scale concentration gradients the transport event is from a local region to a nearby reaction site only Where the effects are on a large scale the diffusion results in a gross transport of over distances larger than molecular dimensions This collection can prove useful for mathematicians cellular biologists physical chemists physiologists electron microscopists geneticists and engineers

Transport Edward D. Korn, 2013-03-09 One property common to all cells is transport Molecules and ions must enter and leave cells by crossing membranes in a controlled manner The process may take any of several forms simple diffusion carrier mediated diffusion active transport or group translocation There is more than one way to measure each Transport kinetics with particular reference to the red blood cell were discussed in a previous volume Three chapters deal with the general subject of transport in this volume Maloney Kashket and Wilson summarize the appropriate methodology for studying metabolite and ion transport in bacteria and Kimmich describes the relevant methodology for the isolated intestinal epithelial cell The methods described in these two chapters have general application to transport studies in single cells from any source The approach described in these two complementary articles is extended in the chapter by Hochstadt and her collaborators on the use of isolated membranes from bacterial and mammalian cells for the study of transport phenomena If one can prepare a suitable plasma membrane fraction sealed impermeable vesicles with the necessary transport components intact it becomes possible to separate the events of transport from any subsequent metabolism that may occur in the cell Isolated membrane vesicles are relatively easy to obtain from bacteria and they are comparatively well studied Work with similar preparations from cultured mammalian cells is just beginning but has much promise
