

Liquid Pressure (Class)

Activity 1

The liquid pressure at a point is dependent on the depth down. At any particular depth, pressure depends on the atmospheric pressure at the top plus a constant dependent on the fact at that depth there will be a column of liquid above it. This column will have a fixed cross-sectional area, and so the weight of the liquid above it will be constant. This will be the same for all points at the same depth. The pressure at a point will be the same for all points at the same depth.

N. Holmes, 1913 THE VAPOR PRESSURES OF 30 INORGANIC LIQUIDS BETWEEN ONE ATMOSPHERE AND THE CRITICAL POINT., 1963 Literature values of the vapor pressures of H₂, HD, D₂, N₂, O₂, Ne, Ar, Kr, Xe, CO, NO, CH₄, N₂O, CO₂, HCl, HBr, HI, SF₆, H₂S, Cl₂, Br₂, NH₃, C₂H₂, SO₂, SO₃, COCl₂, HF, HCN, N₂O₄, CCl₄ and SnCl₄ were compared with the Kirchhoff formula $\log P = A + \frac{B}{T - B}$ between the normal boiling point and the critical point where A and B are determined for each liquid. Plots are presented of the deviations computed by the equation $\log P - \log P_{\text{calc}}$. Based on accurately determined curves for 17 of these substances empirical hypotheses were developed to allow the prediction of the most probable course of the deviation curve in cases where the data appeared to be unreliable. In addition where precise data were available the possibility of the existence of fine structure curvature was demonstrated. The deviation curves were used to obtain tables of interpolated vapor pressure values which are in most cases more accurate by one order of magnitude than any now in the literature particularly where smoothed regression curves do not discriminate between random experimental errors and systematic deviations of an arbitrarily chosen formula from the real vapor pressure curve. Since the deviation curve is invariably shown to approach the zero ordinate at the critical point with a large negative slope the correspondence between the critical pressure and temperature is fixed with a high degree of confidence. A particular result of this work is that the critical pressure of NH₃ was shown to be about one atmosphere higher than the presently accepted value. The new values for the critical points of CH₄, C₂N₂, HCN and Br₂ also resolved differences existing between various authorities in the literature. auth **The Vapor Pressures of Aqueous Solutions of Electrolytes** Edward Otto Heuse, 1915 *Vapor Pressure Curves for C, Ni, Fe, Cr, Mo, W, Cu, Ta, and Al Over the Pressure Range from 10–10 ATM to 1 ATM* A. It is shown that the number of digits required to accurately perform vapor pressure calculations is greater than previously believed. The system permits calculation of the limits of error for any level of confidence. A program is used to analyze and plot the available vapor pressure data for diethyl malonate.
