The Climate in Historical Times Hubertus Fischer, Thomas Kumke, Gerrit Lohmann, Heinrich Miller, Jorg Negendank, 2013-03-14 An Introduction to the KIHZ Project The description of the climate system and the quantification of its natural variability and dynamics is essential to assess an ongoing anthropogenic climate change and to validate climate and biogeochemical models to allow for reliable projections into the future Because the spatio temporal coverage of direct meteorological observations is rather limited high resolution and absolutely dated climate archives represent the only key to a quantification of seasonal to millennial climate variations in the past Furthermore climate models provide insights into the major processes and causes relevant for climate variability on these time scales Both approaches represent one side of the same medal however melting both sides down to one combined effort is often hampered

by obstacles defined by the different nature of the approaches For instance General Circulation Models GCMs per se deal with spatially resolved data representing real climate variables in the model world such as temperature or precipitation with each model run reflecting one possible realization of climate history under given boundary conditions In contrast the records of natural climate archives are influenced by climate variations as they took place in reality however are often representative of local climate conditions only Moreover the climate information deduced from natural archives is in nearly all cases based on climate proxies whose relationship to real climate variables the so called transfer function has to be established beforehand
