Teaching-Learning Contemporary Physics Beata Jarosievitz, Csaba Sükösd, 2021-09-15 This book presents research

contributions focussing on the introduction of contemporary physics topics mainly but not exclusively quantum physics into high school curricula. Despite the important advances and discoveries in quantum physics and relativity which have revolutionized our views of nature and our everyday lives the presence of these topics in high school physics education is still lacking. In this book physics education researchers report on the teaching and learning of quantum physics from different perspectives and discuss the design and use of different pedagogical approaches and educational pathways. There is still much debate as to what content is appropriate at high school level as well what pedagogical approaches and strategies should be adopted to support student learning. Currently there is a greater focus on how to teach modern physics at the high school level rather than classical physics. However teachers still lack experience and availability of appropriate teaching and learning materials to support the coherent integration of Quantum Physics in high school curricula. All of the 19 papers presented in this book discuss innovative approaches for enhancing physics education in schools.

Innovative Computational Intelligence: A Rough Guide to 134 Clever Algorithms Bo Xing, Wen-Jing Gao, 2013-12-13. The first notable feature of this book is its innovation. Computational intelligence (CI) a fast evolving area is currently attracting lots of researchers attention in dealing with many complex problems. At present there are quite a lot competing books existing in the market. Nevertheless the present book is markedly different from the existing books in that it presents new paradigms of CI that have rarely mentioned before as opposed to the traditional CI techniques or methodologies employed in other books. During the past decade a number of new CI algorithms are proposed. Unfortunately they spread in a number of unrelated publishing directions which may hamper the use of such published resources. These provide us with motivation to analyze the existing research for categorizing and synthesizing it in a meaningful manner. The mission of this book is really important since those

algorithms are going to be a new revolution in computer science We hope it will stimulate the readers to make novel contributions or even start a new paradigm based on nature phenomena Although structured as a textbook the book's straightforward self contained style will also appeal to a wide audience of professionals researchers and independent learners We believe that the book will be instrumental in initiating an integrated approach to complex problems by allowing cross fertilization of design principles from different design philosophies The second feature of this book is its comprehensiveness Through an extensive literature research there are 134 innovative CI algorithms covered in this book
