Master protocol for surveillance of pfhrp2/3 deletions and biobanking to support future research World Health Organization, 2020-03-24 Rapid diagnostic test RDT kits offer great potential for the immediate diagnosis of malaria infections. Rapid diagnosis allows for prompt treatment especially in rural settings. Histidine rich protein 2 HRP2 is an abundant protein expressed only by *P. falciparum* and is the target for the most commonly used RDTs. While HRP2 RDTs generally have the highest sensitivity of the RDTs for *P. falciparum* malaria parasite strains in several countries have been identified that have deletions in the genes encoding HRP2 or the similar HRP3 protein. The purpose of this document is to present an updated standardized protocol that *P. falciparum* endemic countries can use to determine the prevalence of parasites with pfhrp2/3 gene deletions causing negative HRP2 RDT results among symptomatic falciparum patients. Two versions are available which allow for a surveillance only approach or a surveillance combined with biobanking for future research approach.
