Climate Change and Policy Gabriele Gramelsberger, Johann Feichter, 2011-03-30 The debate on how mankind should respond to climate change is diverse as the appropriate strategy depends on global as well as local circumstances As scientists are denied the possibility of conducting experiments with the real climate only climate models can give insights into man induced climate change by experimenting with digital climates under varying conditions and by extrapolating past and future states into the future But the nature of models is a purely representational one A model is good if it is believed to represent the relevant processes of a natural system well However a model and its results in particular in the case of climate models which interconnect countless hypotheses is only to some extent testable although an advanced infrastructure of evaluation strategies has been developed involving strategies of model intercomparison ensemble prognoses uncertainty metrics on the system and component levels

The complexity of climate models goes hand in hand with uncertainties but uncertainty is in conflict with socio political expectations However certain predictions belong to the realm of desires and ideals rather than to applied science Today s attempt to define and classify uncertainty in terms of likelihood and confidence reflect this awareness of uncertainty as an integral part of human knowledge in particular on knowledge about possible future developments The contributions in this book give a first hand insight into scientific strategies in dealing with uncertainty by using simulation models and into social political and economical requirements in future projections on climate change Do these strategies and requirements meet each other or fail The debate on how mankind should respond to climate change is diverse as the appropriate strategy depends on global as well as local circumstances As scientists are denied the possibility of conducting experiments with the real climate only climate models can give insights into man induced climate change by experimenting with digital climates under varying conditions and by extrapolating past and future states into the future But the nature of models is a purely representational one A model is good if it is believed to represent the relevant processes of a natural system well However a model and its results in particular in the case of climate models which interconnect countless hypotheses is only to some extent testable although an advanced infrastructure of evaluation strategies has been developed involving strategies of model intercomparison ensemble prognoses uncertainty metrics on the system and component levels The complexity of climate models goes hand in hand with uncertainties but uncertainty is in conflict with socio political expectations However certain predictions belong to the realm of desires and ideals rather than to applied science Today s attempt to define and classify uncertainty in terms of likelihood and confidence reflect this awareness of uncertainty as an integral part of human knowledge in particular on knowledge about possible future developments The contributions in this book give a first hand insight into scientific strategies in dealing with uncertainty by using simulation models and into social political and economical requirements in future projections on climate change Do these strategies and requirements meet each other or fail Gabriele Gramelsberger is Principal Investigator of the Collaborative Research Project is Principal Investigator of the Collaborative Research Project

Terra-Sorta-Firma Fadi Masoud, 2021-05-15 A critical and interdisciplinary exploration of our world's continuously urbanizing and expanding coastline For centuries cities have grown and expanded onto previously saturated grounds reclaiming land from estuaries marshes mangroves and seabeds While these artificial coastlines are sites of tremendous real estate civic and infrastructural investments they are also the most vulnerable to the effects of climate change Terra Sorta Firma documents the global extent of reclaimed coastal lands and provides a framework for comparison across varying geographies cultures and histories It renders visible the ubiquity and precarity of urban coastal reclamation in an age of increased environmental and economic indeterminacy It challenges designers developers policymakers engineers and urbanists to reconsider the design and construction of land itself and to re imagine this most fundamental of all infrastructures along a gradient of inundation
