Catastrophic Thinking David Sepkoski, 2020-09-24 A history of scientific ideas about extinction that explains why we learned to value diversity as a precious resource at the same time as we learned to think catastrophically about extinction We live in an age in which we are repeatedly reminded by scientists by the media by popular culture of the looming threat of mass extinction We re told that human activity is currently producing a sixth mass extinction perhaps of even greater magnitude than the five previous geological catastrophes that drastically altered life on Earth Indeed there is a very real concern that the human species may itself be poised to go the way of the dinosaurs victims of the most recent mass extinction some 65 million years ago How we interpret the causes and consequences of extinction and their ensuing moral imperatives is deeply embedded in the cultural values of any given historical moment And as David Sepkoski reveals the history of scientific ideas about extinction over the past two hundred years as both a past and a current process is implicated in major changes in the way Western society has approached biological and cultural diversity It seems self evident to most of us that diverse ecosystems and societies are intrinsically valuable but the current fascination with diversity is a relatively recent phenomenon In fact the way we value diversity depends crucially on our sense that it is precarious that it is something actively threatened and that its loss could have profound consequences In *Catastrophic Thinking* Sepkoski uncovers how and why we learned to value diversity as a precious resource at the same time as we learned to think catastrophically about extinction

Fundamental Properties of the Human Nervous System V. Nebylitsyn, 2013-03-08 Although today differential psychology embraces a large and ever increasing body of facts conclusions and practical recommendations which have wide applicability a number of critical problems are still unresolved or only partly resolved One of the most important of these is the relationship between individual variations in human behavior and in dividual features of a range of correlated physiological functions Adequate concepts exist for understanding individual variations in some physiological functions underlying specific aspects speed tempo rhythm amplitude of the flow of psychical activity This fact alone is of considerable importance especially when we consider that such dynamic features can and sometimes do in a fundamental way modulate psychological functioning If we consider in addition that in certain circumstances these variables have a direct and sometimes decisive effect on the final behavioral outcome it seems obvious that the parameters of physiologically active systems determine a number of important features of

complex human behavior According to Pavlov the most important of these is that system comprising central nervous system properties which determine the generation of excitatory and inhibitory processes in the structures of the central nervous system The concept of basic nervous system properties as leading parameters of the psychophysiological organization of individuality seems to be one of the outstanding achievements of the Pavlovian school It provided the framework within which investigators could attempt to determine experimentally individual features of behavior and reactivity

Taphonomy Peter A. Allison, David J. Bottjer, 2010-11-03 Taphonomic bias is a pervasive feature of the fossil record A pressing concern however is the extent to which taphonomic processes have varied through the ages It is one thing to work with a biased data set and quite another to work with a bias that has changed with time This book includes work from both new and established researchers who are using laboratory field and database techniques to characterize and quantify the temporal and spatial variation in taphonomic bias It may not provide all the answers but it will at least shed light on the right questions

Individual-based Modeling and Ecology Volker Grimm, Steven F. Railsback, 2013-11-28 Individual based models are an exciting and widely used new tool for ecology These computational models allow scientists to explore the mechanisms through which population and ecosystem ecology arises

from how individuals interact with each other and their environment This book provides the first in depth treatment of individual based modeling and its use to develop theoretical understanding of how ecological systems work an approach the authors call individual based ecology Grimm and Railsback start with a general primer on modeling how to design models that are as simple as possible while still allowing specific problems to be solved and how to move efficiently through a cycle of pattern oriented model design implementation and analysis Next they address the problems of theory and conceptual framework for individual based ecology What is theory That is how do we develop reusable models of how system dynamics arise from characteristics of individuals What conceptual framework do we use when the classical differential equation framework no longer applies An extensive review illustrates the ecological problems that have been addressed with individual based models The authors then identify how the mechanics of building and using individual based models differ from those of traditional science and provide guidance on formulating programming and analyzing models This book will be helpful to ecologists interested in modeling and to other scientists interested in agent based modeling
