|---|---|---|
|  |  |  |
|  |  |  |
| |  |  |

James says if he increases the pattern number by one, square that number and then subtract the pattern number increased by one he will get the general formula.

John says he can derive the general formula for the number of blocks by taking the number of columns in each pattern and multiplying it by the number of rows.

Who is correct between James and John? Prove your answer.

Psychology and Mathematics Education Gila Hanna, Laura Macchi, Karin Binder, Laura Martignon, Katharina Loibl, 2023-09-05 Modern Mathematics is constructed rigorously through proofs based on truths which are either axioms or previously proven theorems. Thus it is par excellence a model of rational inquiry. Links between Cognitive Psychology and Mathematics Education have been particularly strong during the last decades. Indeed the Enlightenment view of the rational human mind that reasons, makes decisions and solves problems based on logic and probabilities was shaken during the second half of the twentieth century. Cognitive psychologists discovered that humans' thoughts and actions often deviate from rules imposed by strict normative theories of inference. Yet these deviations should not be called errors as Cognitive Psychologists have demonstrated these deviations may be either valid heuristics that succeed in the environments in which humans have evolved or biases that are caused by a lack of adaptation to abstract information formats. Humans as the cognitive psychologist and economist Herbert Simon claimed do not usually optimize but rather satisfice even when solving problem. This Research Topic aims at demonstrating that these insights have had a decisive impact on Mathematics Education. We want to stress that we are concerned with the view of bounded rationality that is different from the one espoused by the heuristics and biases program. In Simon's bounded rationality and its direct descendant ecological rationality, rationality is understood in terms of cognitive success in the world correspondence rather than in terms of conformity to content free norms of coherence e.g. transitivity.

New Frontiers for College Education Jim Gallacher, Fiona Reeve, 2018-08-06 The college sector is facing a growing number of new challenges caused by technological change, globalisation and the growth of mass higher education. New Frontiers for College Education considers the impact these changes have had and explores the developing role of college education in countries throughout the world. Whilst analysing the issues associated with providing high quality vocational education and training, the book also reflects on the role of colleges in widening access to both further and higher education. Drawing together contributions from leading international academics, policymakers and practitioners, the book explores common themes across these diverse societies as well as some of the key challenges experienced within individual countries. It considers the distinctive contributions that colleges can make in responding to these challenges through apprenticeships and other types of vocational education and training. Contributors discuss the growing emphasis on creating more integrated systems of tertiary education, recognising that colleges and universities are now expected to work more closely together and that these diverse demands can be difficult to reconcile. Providing an authoritative and timely analysis of the changing role of colleges in contemporary society, this book will be of great interest to academics, researchers and postgraduate students in the areas of further and higher education, vocational education and training, lifelong learning and skills development. It should also be essential reading for policymakers as well as practitioners working in colleges and other institutions of higher and further education.
