Constitutive Models for Rubber

X Alexander Lion, Michael Jöhlitz, 2017-08-15 In order to develop innovative products to reduce development costs and the number of prototypes and to accelerate development processes numerical simulations become more and more attractive As such numerical simulations are instrumental in understanding complicated material properties like chemical ageing crack propagation or the strain and temperature induced crystallisation of rubber Therefore experimentally validated and physically meaningful constitutive models are indispensable Elastomers are used for products like tyres engine and suspension mounts or seals to name a few The interest in modelling the quasi static stress strain behaviour was dominant in the past decades but nowadays the interests also include influences of environmental conditions The latest developments on the material behaviour of elastomers are collected in the present volume Constitutive Models for Rubber X is a comprehensive compilation of nearly all oral and poster contributions to the European Conference on Constitutive Models for Rubber Munich 28 31 August 2017 The 95 highly topical contributions reflect the state of the art in material modelling and testing of elastomers They cover the fields of material testing and processing filler reinforcement electromagnetic sensitive elastomers dynamic properties constitutive modelling micromechanics finite element implementation stress softening chemical ageing fatigue and durability In the area of rubbery materials and structures applied research will play an important role also in the coming decades Constitutive Models for Rubber X is of interest to developers and researchers involved in the rubber processing and CAE software industries as well as for academics in nearly all disciplines of engineering and material sciences
