Gas turbines play an extremely important role in fulfilling a variety of power needs and are mainly used for power generation
and propulsion applications The performance and efficiency of gas turbine engines are to a large extent dependent on turbine
rotor inlet temperatures typically the hotter the better In gas turbines the combustion temperature and the fuel efficiency are
limited by the heat transfer properties of the turbine blades However in pushing the limits of hot gas temperatures while
preventing the melting of blade components in high pressure turbines the use of effective cooling technologies is critical
Increasing the turbine inlet temperature also increases heat transferred to the turbine blade and it is possible that the
operating temperature could reach far above permissible metal temperature In such cases insufficient cooling of turbine
blades results in excessive thermal stress on the blades causing premature blade failure This may bring hazards to the
