Verification and Validation in Systems Engineering Mourad Debbabi,Fawzi Hassaïne,Yosr Jarraya,Andrei Soeanu,Luay Alawneh,2010-11-16 At the dawn of the 21st century and the information age communication and computing power are becoming ever increasingly available virtually pervading almost every aspect of modern socio economical interactions Consequently the potential for realizing a significantly greater number of technology

mediated activities has emerged. Indeed, many of our modern activities are heavily dependant upon various underlying systems and software intensive platforms. Such technologies are commonly used in everyday activities such as commuting, traffic control and management, mobile computing, navigation, mobile communication. Thus, the correct function of the forenamed computing systems becomes a major concern. This is all the more important since, in spite of the numerous updates, patches, and firmware revisions being constantly issued, newly discovered logical bugs in a wide range of modern software platforms, e.g. operating systems and software intensive systems, e.g. embedded systems, are just as frequently being reported. In addition, many of today's products and services are presently being deployed in a highly competitive environment wherein a product or service is succeeding in most of the cases thanks to its quality to price ratio for a given set of features. Accordingly, a number of critical aspects have to be considered such as the ability to pack as many features as needed in a given product or service while currently maintaining high quality, reasonable price, and short time to market.
