cell structure using LM is that they do not see the outlines of cells and for the most part they do not see the internal structure of the cell very clearly This is because the cell membrane and most of the internal structures are beyond the high resolution of the LM Electron microscopy on the other hand magnifies cell organelles and enhances their resolution making the interpretation of cell structure more precise and objective However there are limitations in the study of ultrastructure since only a very small section of the cell is viewed Electron microscopy as we all know is laborious and very time consuming and has been used widely in biomedical research since 1935 We were the first to study embryonic stem cells by TEM a logical progression of our extensive research on human gametes fertilization and embryos in IVF ART The reader is advised to study images of cells and tissues in semi thin epoxy sections LM This EBook atlas will be a valuable supplement to the numerous textbooks of histology especially those with colour LMs of wax and epoxy sections It covers the ultrastructure of the human cell the basic tissues of the human body and some of the more important organs of the human body It is specifically targeted to researchers involved in current stem cell research both adult and embryonic Finally this publication is not intended to be a complete atlas of human cells and tissues since there are several excellent publications for the advanced study of electron microscopy a few listed in the references
