Anthony,2003-09-18 Conservation of mammals in the coniferous forests of western North America has shifted in recent years from species based strategies to community and ecosystem based strategies resulting in an increase in the available information on mammalian communities and their management This book provides a synthesis of the published literature on the role of forest mammals in community structure and function with emphasis on their management and conservation In addition to coverage of some of the charismatic megafauna such as grizzly bears gray wolves mountain lions elk and moose the book also provides a thorough treatment of small terrestrial mammals arboreal rodents bats medium sized carnivores and ungulates The unique blend of theoretical and practical concepts makes this book equally suitable for managers educators and research biologists who will find it a valuable reference to the recent literature on a vast array of topics on mammalian ecology   **Uinta National Forest (N.F.), Land and Resource Management Plan, Juab, Sanpete, Tooele, Utah and Wasatch Counties** ,2003   Using Forest Inventory and Analysis Data and the Forest Vegetation Simulator to Predict and Monitor Fisher (Martes Pennanti) Resting Habitat Suitability ,2010 New knowledge from wildlife habitat relationship models is often difficult to implement in a management context This can occur because researchers do not always consider whether managers have access to information about environmental covariates that permit the models to be applied Moreover ecosystem management requires knowledge about the condition of habitats over large geographic regions whereas most research projects have limited spatial inference For example research has revealed much about the habitat of fishers Martes pennanti at various research sites in California yet this work has not been translated into practical tools that managers can use to monitor fisher habitat regionally or to evaluate and mitigate the effects of proposed forest management on fisher habitat This led us to create new habitat models that are intimately linked to agency approaches to forest monitoring and software tools used by forest managers to plan timber harvests and vegetation management We created habitat models that were integrated with these approaches and tools that forest managers use for two purposes to inventory forest resources i e Forest Inventory and Analysis FIA plots and to simulate the response of stands to harvest fire insects disease and other disturbances i e Forest Vegetation Simulator FVS In this paper we provide an example of how to assess and monitor wildlife habitat using FIA vegetation monitoring protocols We also provide an example of how to integrate an existing FIA based model of fisher resting habitat into FVS software that simulates the effect of alternative silvicultural treatments on vegetation data collected from field plots Using these tools we produce quantitative predictions of the status of resting habitat quality for fishers and describe how it can be monitored over time We also provide an example of the effect of vegetation treatments on predicted fisher resting habitat which illustrates a process that can be used to understand reduce or mitigate the effects of these activities on fisher habitat This work on the

fisher provides one example of how habitat assessments for wildlife could be advanced if they were developed with management applicability and implementation success as a goal   **Targhee National Forest (N.F.), Forest Plan Revisions, Bonneville County, Butte County, Clark County, Fremont County, Jefferson County, Lemhi County, Madison County, Teton County** ,1996   Rogue River-Siskiyou National Forest (N.F.), Eden Ridge Timber Sales, Coos County ,2012   **Uinta National Forest: Appendices.
