Background

The Nervous System

The nervous system is an incredibly complex network of tissues that are capable of carrying information throughout the human body. The two primary cells of the nervous system are neurons, that actually carry and store information, and glial cells that support the neurons. The nervous system is broken up into a few systems depending on the function and location.

Central Nervous System

The central nervous system, or CNS, is made up of the brain and spinal cord. The retina of the eye is also considered part of the central nervous system. The brain is the control center of the body and is housed within the protective hard skull. Layers of tissues called meninges and cerebrospinal fluid also protect the CNS. The spinal cord extends from the brainstem through the vertebral column. There are 31 segments to the spinal cord, and a pair of spinal nerves extends from each segment into the body.

Peripheral Nervous System

There are 43 pairs of nerves that connect the central nervous system to the rest of the body, and they make up the peripheral nervous system or PNS. The PNS is made up of sensory neurons that are capable of receiving stimuli, and motor neurons that are capable of responding to stimuli. For example, sensory neurons in the eye are capable of receiving light stimuli and motor neurons are attached to muscles that can create movement.

The PNS is broken down into the somatic and autonomic nervous systems, and the autonomic is further broken down into the sympathetic and parasympathetic nervous systems. Diagram A summarizes the relationship between these systems. The somatic NS is the voluntary system that can be controlled consciously, such as movement of muscles. The autonomic NS is the involuntary system and controls unconscious impulses such as the heartbeat. The sympathetic and parasympathetic systems work opposite of one another. For example, the sympathetic system speeds up the heart rate while the parasympathetic system slows down the heart rate.

The Neuron

The neuron is the functional cell of the nervous system. It can send and receive nerve impulses. There are billions of neurons in the body, with more than 100 billion on the surface of the brain alone. Even so, approximately 90% of cells in the brain are supportive glial cells and only 10% are actual neurons. Neurons are made up of a cell body, dendrites, an axon, and axon terminals. When

The Nervous System Haspi Medical Anatomy:

The Gross and Minute Anatomy of the Central Nervous System Hermon C Gordinier, 2023-07-18 This comprehensive guide to the central nervous system provides detailed illustrations and descriptions of its anatomy. Originally published in 1905, Gordinier's work includes information on the structure and function of the brain and spinal cord as well as their various component parts. It is an essential resource for students of neuroscience and medical professionals alike. This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it. This work is in the public domain in the United States of America and possibly other nations. Within the United States, you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work. Scholars believe and we concur that this work is important enough to be preserved, reproduced, and made generally available to the public. We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant.

The Human Central Nervous System Rudolf Nieuwenhuys, Jan Voogd, Christiaan van Huijzen, 2007-12-31 The present edition of *The Human Central Nervous System* differs considerably from its predecessors. In previous editions, the text was essentially confined to a section dealing with the various functional systems of the brain. This section, which has been rewritten and updated, is now preceded by 15 newly written chapters which introduce the pictorial material of the gross anatomy, the blood vessels and meninges, and the microstructure of its various parts, and deal with the development, topography, and functional anatomy of the spinal cord, the brain stem, and the cerebellum, the diencephalon, and the telencephalon. Great pains have been taken to cover the most recent concepts and data. As suggested by the front cover, there is a focus on the evolutionary development of the human brain. Throughout the text, numerous correlations with neuropathology and clinical neurology have been made. After much thought, we decided to replace the full Latin terminology cherished in all previous editions with English and Anglicized Latin terms. It has been an emotional farewell from beautiful terms such as *decussatio hipposideriformis*, *Wnekinkii*, and *pontes grisei caudatolenticulares*. Not only the text but also the pictorial material has been extended and brought into harmony with the present state of knowledge. More than 230 new illustrations have been added, and many others have been revised. The number of macroscopical sections through the brain has been extended considerably. Together, these illustrations now comprise a complete and convenient atlas for interpreting neuroimaging studies.

An Illustrated Review of the Nervous System Glenn F. Bastian, 1993 This series of brief, inexpensive workbooks supplements texts in A/P, especially Elaine Marieb's *Human Anatomy and Physiology*, Fifth Edition, and provides a quick and efficient study review for nursing and allied health students. This workbook reviews the nervous system.

Principles of Neuroanatomy Jay B. Angevine, Carl W. Cotman, 1981 An excellent point of departure for all who undertake the study of the connections between the nervous system and behavior. *Neuropsychologia* Enthusiastically recommended to readers being introduced to neuroanatomy. *The New England Journal of Medicine* Provides a much more

comprehensible account of the nervous system than most others that are available and relates structure to current views as to functional organization in an interesting and helpful manner

Brain *The Human Nervous System* Juergen K Mai, George Paxinos, 2011-12-13 The previous two editions of the Human Nervous System have been the standard reference for the anatomy of the central and peripheral nervous system of the human The work has attracted nearly 2 000 citations demonstrating that it has a major influence in the field of neuroscience The 3e is a complete and updated revision with new chapters covering genes and anatomy gene expression studies and glia cells The book continues to be an excellent companion to the Atlas of the Human Brain and a common nomenclature throughout the book is enforced Physiological data functional concepts and correlates to the neuroanatomy of the major model systems rat and mouse as well as brain function round out the new edition Adopts standard nomenclature following the new scheme by Paxinos Watson and Puelles and aligned with the Mai et al Atlas of the Human Brain new edition in 2007 Full color throughout with many new and significantly enhanced illustrations Provides essential reference information for users in conjunction with brain atlases for the identification of brain structures the connectivity between different areas and to evaluate data collected in anatomical physiological pharmacological behavioral and imaging studies
