Drop, 2016-11-03 Understanding how humans control a vehicle cars aircraft bicycles etc enables engineers to design faster safer more comfortable more energy efficient more versatile and thus better vehicles In a typical control task the Human Controller HC gives control inputs to a vehicle such that it follows a particular reference path e g the road accurately The HC is simultaneously required to attenuate the effect of disturbances e g turbulence perturbing the intended path of the vehicle To do so the HC can use a control organization that resembles a

closed loop feedback controller a feedforward controller or a combination of both Previous research has shown that a purely closed loop feedback control organization is observed only in specific control tasks that do not resemble realistic control tasks in which the information presented to the human is very limited In realistic tasks a feedforward control strategy is to be expected yet almost all previously available HC models describe the human as a pure feedback controller lacking the important feedforward response Therefore the goal of the research described in this thesis was to obtain a fundamental understanding of feedforward in human manual control First a novel system identification method was developed which was necessary to identify human control dynamics in control tasks involving realistic reference signals Second the novel identification method was used to investigate three important aspects of feedforward through human in the loop experiments which resulted in a control theoretical model of feedforward in manual control The central element of the feedforward model is the inverse of the vehicle dynamics equal to the theoretically ideal feedforward dynamics However it was also found that the HC is not able to apply a feedforward response with these ideal dynamics and that limitations in the perception cognition and action loop need to be modeled by additional model elements a gain a time delay and a low pass filter Overall the thesis demonstrated that feedforward is indeed an essential part of human manual control behavior and should be accounted for in many human machine applications
