Function of the Nervous System

The nervous system has three specific functions:

1. _____ signals from receptors in the _____ and _____ (sensory) organs and sends _____ back to the _____ (motor) organs.
2. _____ controls and coordinates _____ and _____ in response to signals it receives.
3. _____ controls _____ and _____.

1. _____ The _____ and _____ control the rest of the body. _____ signals in the _____ are sent up the _____ (spinal cord).
2. _____ The _____ controls and coordinates _____ and _____ in response to signals it receives. _____ controls _____ and _____.
3. _____ The _____ controls _____ and _____.

Topic: _____

Autonomic Nervous System

The Autonomic Nervous System is part of the nervous system that regulates involuntary functions. It controls the internal organs and glands of the body.

It is divided into two main branches:

- Sympathetic Nervous System** (fight or flight)
- Parasympathetic Nervous System** (rest and digest)

The Autonomic Nervous System is responsible for controlling the following functions:

- Heart rate
- Blood pressure
- Respiration
- Digestion
- Excretion
- Reproduction

The Autonomic Nervous System is controlled by the brain and spinal cord.

Brain and Spinal Cord

The brain and spinal cord are the central parts of the nervous system. They are responsible for controlling all the functions of the body.

The brain is divided into three main parts:

- Cerebrum** (the largest part, responsible for thinking and reasoning)
- Cerebellum** (responsible for balance and coordination)
- Brainstem** (responsible for basic life functions like breathing and heart rate)

The spinal cord is a long, thin, tube-like structure that runs down the back. It is responsible for carrying messages between the brain and the rest of the body.

Autonomic Nervous System

The Autonomic Nervous System is responsible for controlling the internal organs and glands of the body. It is divided into two main branches: Sympathetic and Parasympathetic.

The Sympathetic Nervous System is responsible for the 'fight or flight' response. It increases heart rate, blood pressure, and respiration, and decreases digestion.

The Parasympathetic Nervous System is responsible for the 'rest and digest' response. It decreases heart rate, blood pressure, and respiration, and increases digestion.

Structure of the brain

The brain is divided into four main regions: the cerebrum, cerebellum, brainstem, and diencephalon. The cerebrum is the largest part of the brain and is responsible for most of the higher functions of the brain, such as thought, memory, and emotion. The cerebellum is located at the back of the brain and is responsible for coordination and balance. The brainstem is located in the center of the brain and is responsible for basic functions such as breathing and heart rate. The diencephalon is located between the cerebrum and the brainstem and is responsible for functions such as vision and hearing.

The diagram shows a sagittal section of the human brain. The cerebrum is the large, outer part of the brain, divided into two hemispheres. The cerebellum is the smaller, more rounded part at the back of the brain. The brainstem is the central part of the brain, connecting the cerebrum and cerebellum. The diencephalon is the part of the brain between the cerebrum and the brainstem.

Division of the Nervous System

The nervous system is divided into the central nervous system and the peripheral nervous system.

Central Nervous System

The central nervous system (CNS) includes the _____ and the _____.

Peripheral Nervous System

The peripheral nervous system (PNS) includes all the _____ and _____ of the body that are not part of the CNS.

Somatosensory Nervous System

The somatosensory nervous system is responsible for processing information from the _____ and _____.

Autonomic Nervous System

The autonomic nervous system (ANS) controls involuntary functions of the body.

Sympathetic Nervous System

The sympathetic nervous system is responsible for the 'fight or flight' response.

Parasympathetic Nervous System

The parasympathetic nervous system is responsible for the 'rest and digest' response.

Journal of Learning **Self-Organization in the Nervous System** Yan M. Yufik, Biswa Sengupta, Karl Friston, 2017-11-30

This special issue reviews state of the art approaches to the biophysical roots of cognition. These approaches appeal to the notion that cognitive capacities serve to optimize responses to changing external conditions. Crucially, this optimisation rests on the ability to predict changes in the environment, thus allowing organisms to respond preemptively to changes before their onset. The biophysical mechanisms that underwrite these cognitive capacities remain largely unknown, although a number of hypotheses has been advanced in systems neuroscience, biophysics, and other disciplines. These hypotheses converge on the intersection of thermodynamic and information theoretic formulations of self-organization in the brain. The latter perspective emerged when Shannon's theory of message transmission in communication systems was used to characterise message passing between neurons. In its subsequent incarnations, the information theory approach has been integrated into computational neuroscience and the Bayesian brain framework. The thermodynamic formulation rests on a view of the brain as an aggregation of stochastic microprocessors, neurons, with subsequent appeal to the constructs of statistical mechanics and thermodynamics. In particular, the use of ensemble dynamics to elucidate the relationship between micro-scale parameters and those of the macro-scale aggregation of the brain. In general, the thermodynamic approach treats the brain as a dissipative system and seeks to represent the development and functioning of cognitive mechanisms as collective capacities that emerge in the course of self-organization. Its explicanda include energy efficiency enabling progressively more complex cognitive operations such as long-term prediction and anticipatory planning. A cardinal example of the Bayesian brain approach is the free energy principle that explains self-organizing dynamics in the brain in terms of its predictive capabilities and selective sampling of sensory inputs that optimise variational free energy as a proxy for Bayesian model evidence. An example of thermodynamically grounded proposals in this issue associates self-organization with phase transitions in neuronal state spaces, resulting in the formation of bounded neuronal assemblies, neuronal packets. This special issue seeks a discourse between thermodynamic and informational formulations of the self-organising and self-evidencing brain. For example, could minimization of thermodynamic free energy during the formation of neuronal packets underlie minimization of variational free energy?

Neuroglia: Function and Pathology Alexei Verkhratsky, Arthur Butt, 2023-05-12

Diverse specialised neuroglial cells guarantee the development, preservation, and health of the central nervous system, the peripheral nervous system, the enteric nervous system, and the special senses. In the central nervous system, it is the astrocytes, oligodendrocytes, and microglia that safeguard nerve cell function and integrity, that controls all behaviours, and encompasses the cerebral cortex of the brain, which is the root of humanity. In the peripheral nervous system, Schwann cells play the leading role together with satellite glial cells of the sensory and autonomic ganglia, ensuring correct communication between the organs and tissues with the brain and the spinal cord. In the enteric nervous system, specialised enteric glial cells maintain all aspects of gastrointestinal function. Then there are distinctive glial cells of the special senses that ensure how the

body perceives and reacts to its environment In pathology neuroglia strive to protect the diverse cellular components of the nervous system and are responsible for a proactive programme of posttraumatic restructuring that is aimed at recovery of life sustaining function Neuroglia Function and Pathology provides a highly original and comprehensive account of the physiology and pathophysiology of glial cells in the central and peripheral nervous systems The first part of the book provides a far reaching description of glial cell form and function from their evolution in invertebrates to their complexity in humans encompassing the developmental origin of the varied glial cell types and their diversity of morphology molecular biology and cellular physiology The second part of the book is devoted to an all embracing evaluation of glial cell pathophysiology commencing with definitive explanations of the fundamental pathologies of the main glial cell types and ending in a systematic examination of glial contributions to specific neurological diseases This book emphasises the central roles played by the different classes of neuroglial cells in the progression and outcome of neurological disorders of the central and peripheral nervous systems and highlights potential of glial cells as therapeutic targets The book contains more than 2500 key references from over 150 years of glial research and is superbly illustrated with over 350 original and explanatory full colour figures that describe the diverse characteristics and properties of glial cells in health and disease Under the same cover this book combines an authoritative reference book for research and clinical neuroscientists and at the same time serves as an instructive textbook for students of neuroscience from undergraduates to postgraduates Single volume covering key aspects of glial cell physiology and pathology In depth overview of the history of glial cell research Comprehensive review of glial cell physiology and pathology Authoritative special chapters on the major neurological diseases Full colour throughout with 360 illustrations
