Visualizing Biological Information Clifford A Pickover, 1995-12-15 Biological data of all kinds is proliferating at an incredible rate. If humans attempt to read such data in the form of numbers and letters they will take in the information at a snail's pace. If the information is rendered graphically however, human analysts can assimilate it and gain insight at a much faster rate. The emphasis of this book is on the graphic representation of information containing sequences such as DNA and amino acid sequences in order to help the human analyst find interesting and biologically relevant patterns. The editor's goal is to make this voyage through molecular biology, genetics, and computer graphics as accessible to a broad audience as possible with the inclusion of glossaries at the end of most chapters and program outlines where applicable. The book will be of most interest to biologists and computer scientists, and the various large reference lists should be of interest to beginners and advanced students of biology, graphic art, and computer science. Contributors have sought to find pattern and meaning in the cacophony of genetic and protein sequence data using unusual computer graphics and musical techniques. *The Population Ecology and Conservation of Charadrius Plovers* Mark A. Colwell, Susan M. Haig, 2019-04-26 The 40 or so species of beach-loving plovers, genus *Charadrius*, comprise a diverse group of shorebirds found around the world. Most of these species are challenged by changing climates and other human-related development activities, yet they provide key insights into basic ecological and evolutionary processes. The expert international contributors take a comparative approach, presenting examples from many worldwide plover studies and synthesizing the group's most pressing and important topics. The book further presents an emphasis on full life cycle biology, including the importance of examining migratory connectivity issues, even for non-migratory plovers. Color pages were planned and approved for some pages in this volume, but due to a printing error, some copies have incorrectly been released with these pages printed in black and white. Wich, Andrew J. Marshall, 2016-07-07 The number of primates on the brink of extinction continues to grow, and the need to respond with effective conservation measures has never been greater. This book provides a comprehensive and state-of-the-art synthesis of

research principles and applied management practices for primate conservation It begins with a consideration of the biological intellectual economic and ecological importance of primates and a summary of the threats that they face before going on to consider these threats in more detail with chapters on habitat change trade hunting infectious diseases and climate change Potential solutions in the form of management practice are examined in detail including chapters on conservation genetics protected areas and translocation An Introduction to Primate Conservation brings together an international team of specialists with wide ranging expertise across primate taxa This is an essential textbook for advanced undergraduates graduate students and established researchers in the fields of primate ecology and conservation biology It will also be a valuable reference for conservation practitioners land managers and professional primatologists worldwide

Responses to Climate Change in the Cold Biomes Hans J. De Boeck,Erika Hiltbrunner,Anke Jentsch,Vigdis

Vandvik,2019-06-05 Climate change is thought to be especially relevant to ecosystems in the cold biomes Observed warming has been higher in cold climates through various positive feedbacks especially declining snow and ice cover and climate projections indicate further rapid warming in the decades to come Temperature change can have profound impacts in cold biome ecosystems either directly in terms of impacts on physiology or growing season length or indirectly via changes in nutrient cycling The regions focused on here are the sub arctic and the sub alpine areas both characterized by short growing seasons and low annual temperatures but with different radiation environments depending on latitude Climate change can have impacts in all seasons Increased spring temperatures can accelerate snowmelt leading to an earlier onset of the growing season while warmer summers may stimulate primary productivity through temperatures closer to metabolic optima and or increased mineralization rates Winter warming can lead to the vegetation being damaged because of exposure to harsh frost without insulating snow cover In all of this concurrent changes in precipitation also play an important role increased snowfall can buffer warming induced advances in snowmelt a higher ratio of rain to snow can greatly accelerate snowmelt in winter and spring and summer drought may reverse growth stimulation by warming directly drought stress or indirectly e.g impaired nutrient uptake Micro climate is crucial in these systems and requires particular attention as it can

vary widely across the landscape creating different growing environments in the space of a few meters or even less Interest in cold region responses to climate change does not only arise from the fact that they harbor unique ecosystems that may be endangered but also because they store large amounts of carbon that may be released under climate change However research is challenging because of the remoteness of many of these areas and the harsh conditions during much of the year In spite of this some studies have been carried out over an extensive period spanning decades and yielding information on for example plant community reorganization including invasions and changes in phenology above and or belowground Other studies focus on shorter term effects such as impacts of heat waves late frosts or other anomalous weather including longer term after effects that may differ drastically from other regions because of the short growing season in cold climates Ultimately models are used to predict future changes in vegetation along latitudinal or elevational gradients although phenology and microclimatic variation may pose particular challenges Contributions to this Research Topic focus on climate change encompassing both changes in the mean gradual warming and variability heat waves altered precipitation distribution in cold biomes The Topic contains reports on observed changes or events but also research making use of experimentally imposed environmental changes The focus is varied including phenology physiology soil and vegetation science and biogeochemistry with the aim of providing a comprehensive overview of observed and expected responses to climate change in cold biome ecosystems

Birds of Nunavut James M. Richards, Anthony J. Gaston, 2018-08-15 Nunavut is a land of islands encompassing some of the most remote places on Earth It is also home to some of the world's most fascinating bird species The windswept tundra rocky shorelines and icy waters of this thinly populated land are integral to the survival of numerous breeding and non breeding birds including the colourful King Eider the stately Snowy Owl the spritely Snow Bunting and the globe spanning Northern Wheatear Birds of Nunavut is the first complete survey of every species known to occur in the territory It is co written by a team of eighteen experts who have conducted a combined total of 300 seasons of fieldwork in Nunavut They document 295 species of birds of which 145 are known to breed in the territory presenting a wealth of information on identification distribution ecology behaviour and conservation Lavishly illustrated with over 800 colour photographs and 155 maps it is a visually stunning reference work on the birds that live in and visit Nunavut
