The Newman Lectures on Thermodynamics John S. Newman, Vincent S. Battaglia, 2019-06-21 Prof Newman is considered one of the great chemical engineers of his time His reputation derives from his mastery of all phases of the subject matter his clarity of thought and his ability to reduce complex problems to their essential core elements He has been teaching undergraduate and graduate core subject courses at the University of California Berkeley UC Berkeley USA since joining the faculty in 1966 His method is to write out in long form everything he expects to convey to his class on a subject on any given day He has maintained and updated his lecture notes from notepad to computer throughout his career This book is an exact reproduction of those notes The book presents concepts needed to define single and multi component systems starting with the Gibbs function It helps readers derive concepts of entropy and temperature and the development of material properties of pure substances It acquaints them with applications of thermodynamics such as cycles open systems and phase transitions and eventually leads them to concepts of multiple component systems in particular chemical and phase equilibria It clearly presents all concepts that are necessary for engineers

Thermodynamics of Solutions Eli Ruckenstein, Ivan L. Shulgin, 2009-06-17 This book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade Even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book First these papers are concerned with difficult or very nonideal systems i e systems with very strong interactions e g hyd gen bonding between components or systems with large differences in the partial molar v umes of the components e g the aqueous solutions of proteins or systems that are far from normal conditions e g critical or near critical mixtures Second the

conventional thermodynamic methods are not sufficient for the accurate treatment of these mixtures. Last but not least, these systems are of interest for the pharmaceutical, biomedical, and related industries. In order to meet the thermodynamic challenges involved in these complex mixtures, we employed a variety of traditional methods but also new methods such as the fluctuation theory of Kirkwood and Buff and ab initio quantum mechanical techniques. The Kirkwood-Buff (KB) theory is a rigorous formalism which is free of any of the approximations usually used in the thermodynamic treatment of multicomponent systems. This theory appears to be very fruitful when applied to the above-mentioned difficult systems.
