guidance to lubrication practice in industry with the emphasis on practical application Specific guidance is given regarding the appropriate selection of lubricants for a wide range of uses *The Use of a Fire-Resistant Turbine Lubricant* WD. Phillips, 2001 Turbine oil fires continue to cause concern Although not frequent occurrences a serious fire can have an enormous financial impact To reduce the risk of hydraulic oil fires in steam turbines phosphate esters are now widely used but large volumes of inflammable mineral oil remain in the lubrication system In order to decrease the fire risk still further phosphates have also been used in both steam and gas turbines as fire resistant lubricants This paper reviews the need for these products and the experience in both trials and commercial operation It examines the reasons for their slow adoption by industry but also why current market pressures particularly in Europe are likely to accelerate their use **Specification for Turbine Lubricants** British Standards Institute Staff, 1999-12-15 Steam turbines Lubricating oils Petroleum products Mineral oils Oils Marking Rust protection Corrosion tests Immersion tests corrosion Grades quality Viscosity Chemical indices Foaming power Flash point Pour point Emulsifying Acidity Oxidation resistance *Turbine Oil Monitoring* William C. Hartwig, W. D. Phillips, 1990 The risk of the fire in power stations arising from the ignition of mineral turbine oil is ever present despite the use of protective devices The hazard can be substantially reduced by the use of a fire resistant lubricant and the paper describes the use of a triaryl phosphate fluid to lubricate a 10 MW back pressure steam turbine and a 6 MW industrial gas turbine After about 56 000 hours total use in the two machines the fluid quality is still excellent No fluid related operational problems have been found and leaks which would have caused fires had mineral oil been used did not result in ignition of the fluid
