an excellent material for electronic devices operating at high temperatures thanks to its large energy band gap superior mechanical properties and extreme chemical inertness Among the numerous polytypes of SiC the cubic single crystal which is also well known as 3C SiC is the most promising platform for microelectromechanical MEMS applications as it can be epitaxially grown on an Si substrate with diameters of up to several hundred millimeters This feature makes 3C SiC compatible with the conventional Si based micro nano processing and also cuts down the cost of SiC wafers The investigation into the piezoresistive effect in 3C SiC is of significant interest for the development of mechanical transducers such as pressure sensors and strain sensors used for controlling combustion and deep well drilling Although a number of studies have focused on the piezoresistive effect in n type 3C SiC 4H SiC and 6H SiC comparatively little attention has been paid to piezoresistance in p type 3C SiC In addition the book investigates the piezoresistive effect of top down fabricated SiC nanowires revealing a high degree of sensitivity in nanowires employing an innovative nano strain amplifier The large gauge factors of the p type 3C SiC at both room temperature and high temperatures found here indicate that this polytype could be suitable for the development of mechanical sensing devices operating in harsh environments with high temperatures
