Wetlands are amazing ecosystems and can be found all over the United States. They occur along the boundaries of streams, lakes, ponds or even in large shallow holes that fill up with rainwater. In order to have a wetland, you need to have some low-lying land, add water, then mix in lots of plants that have living wet "feet" (roots) and finally add some animals. There are many kinds of wetlands: marshes, bogs, swamps, fens, and prairie potholes to name a few. These places can look very different, but because they are all areas with wet soil, or where water covers the soil, they are considered wetlands.

What type of wetlands are near you?

Every critter plays an important part in a healthy wetland. From primary producers, on up the food chain of consumers to decomposers, everything is connected. Draw a line from the terms below to the plants or animals you see on this page that fit that level of the food chain!

primary producer  
primary consumer  
secondary consumer  
tertiary consumer  
decomposer

Cut out the squares below and place them over parts of the picture that serve the described function of a wetland.

## Habitat

More than 60% of endangered and threatened animals and plants in the United States depend on wetlands to survive.

## Food

Wetlands are very productive because of all of the plants they contain. These help form the base of the food chain.

## Filtration

Wetlands are great at filtering water coming off the land, reducing pollution to keep off the bottom of your water supply.

## Nursery

Wetlands provide nursery habitat for most of the juvenile (young) fish and shellfish that we eat.

## Flood Control

By slowing the water during floods, wetlands reduce flood damage to areas downstream and around them.

Use this page once for definitions of the food chain terms and once more to make your own label boxes!
