1. Scoope

I.I The primary objective of metallographic examinations is to reveal the constituents and structure of metals and their alloys by means of a light optical or scanning electron microscope. In special cases, the objective of the examination may require the development of less detail than in other cases but, under nearly all conditions, the proper selection and preparation of the specimen is of major importance. Because of the diversity in available equipment and the wide variety of problems encountered, the following text presents for the guidance of the metallographer only those practices which experience has shown are generally satisfactory; it cannot and does not describe the variations in technique required to solve individual specimen preparation problems.

Note 1.—For a more extensive description of various metallographic techniques, refer to Santuels, L. E., Menallographic Politiching by MecAonical Methods, American Society for Metals (ASM) Metals Park, OH, 3rd Ed., 1982; Petrem, G., Metallographic Etching, ASM, 1978; and Ed., 1988; Metallography: Principles and Practice, McGraw Hill, NY, 2nd Ed., 1999.

1.2 This standard does not purport to address all of the sofery concerns. If any, associated with its use, it is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 contable mount—a metallographic mount generally made from a two component castable plantic. One component is the resin and the other hardener. Both components can be liquid or one liquid and a powder. Castable mounts generally do not require heat and pressure to cure.

3.2.2 compression mount—a metallographic mount made using plastic that requires both heat and pressure for curing.

3.2.3 planor grinding—is the first grinding step in a preparation procedure used to bring all specimens into the same plane of polish. It is unique to semi or fully automatic preparation equipment that utilize specimen holders.

3.2.4 rigid grinding disc—a non-fabric support surface, such as a composite of metal/ceramic or metal/polymer charged with an abrasive (usually 6 to 15µm diamond particles), and used as the fine grinding operation in a metal-lographic preparation procedure.
