

How to use an AED

You're in the mall, and suddenly the shopper next to you collapses. On the wall is an automated external defibrillator (AED), a device that can shock a heart in cardiac arrest back into a normal rhythm. Although sending electricity through an unconscious stranger's heart may seem like something best left to a professional, AEDs can be used successfully by passersby with no training. And the sooner the better: Survival rates are near 90 percent for people treated within the first minute.

- 1** Call 911 to get the professionals moving in your direction. Have someone else do **CPR chest compressions**. Clear the area of flammable liquids and standing water.

- 2** Turn on the AED. Open the case (in this model, you pull the plastic cover). This will activate **voice commands**. If the information button flashes, press it for more info.

All clothes must be removed from the chest area.

- 3** Stick the **adhesive electrode pads** to the person's bare chest according to the diagram on the machine. The pad labeled "right" goes above the right nipple; the "left" one goes below the left nipple along the ribcage.

The pads have an adhesive liner.

- 4** The machine will **analyze the heart rhythm** and in less than eight seconds determine whether a shock is needed. No one should touch the patient during the analysis. If the device indicates, stand clear and **hit the shock button**.

- 5** After the shock, continue **CPR until you see signs of life**. The machine can fire a second time if needed. (If the machine says not to fire, continue CPR until the paramedics arrive.)

Note: Don't worry: You can't accidentally shock someone who doesn't need it. If the machine decides that the person is not in cardiac arrest, it simply won't fire.
