Communication Circuit for Wireless Data Transmission and Radio Frequency Argumentation Dr. Anusiuba Overcomer Ifeanyi Alex,Dr. Ibrahim M. M. El EMary,Dr. Eissa Mohammed Ali Qhal,2022-12-23 The societal reliance upon wireless systems continues to rise due to mobile data interchange A closer look at the current allocation of 38 GHz 5G Cellular is desperately pointing to and suggesting the crowding of the frequency spectrum Therefore this study explores visible light communication as one of the emerging technologies to help meet up with these challenges The Visible Light Communication VLC refers to the communication technology which utilizes the visible light source as a signal transmitter the air as a transmission medium and the appropriate photodiode as a signal receiving component This study appraises the extant literature on Solid State Lighting SSL with emphasis on Light Emitting Diodes LEDs The study highlights the weaknesses of the existing system the advantages and the significance of the new system using prototype methodology The study focused on the design and implementation of Visible Light Communication VLC circuit for wireless data transmission by designing an analog circuit to integrate with a computer or mobile phone and then sending some form of data using visible light LEDs from a transmitter and decoding it with a receiver The design adopted Beagle Bone Black BBB as development platform and the circuit was tested with Proteus 8 Professional and data sent reliably and accurately over a short distance at a fair speed which ensures that the initial goals for the functionality of this new system which includes being able to send audio text or pictures over a distance of approximately 10 meter at a data rate of at least 10 Mbps was achieved The study shows that visible light communication has the potential to provide high speed data communication with improved energy efficiency and communication security privacy due to its unique characteristics and advantages Also Visible Light Communication can complement the RF based mobile communication systems in designing high capacity mobile data networks and can be incorporated in the next generation 5G network The study therefore recommends error control mechanism and Dimming Support to be integrated in the subsequent studies Printed Antennas for Wireless

Communications Rod Waterhouse,2008-03-11 Printed antennas also known as microstrip antennas have a variety of beneficial properties including mechanical durability conformability compactness and cheap manufacturing costs As such they have a range of applications in both the military and commercial sectors and are often mounted on the exterior of aircraft and spacecraft as well as incorporated into mobile radio communication devices Printed Antennas for Wireless Communications offers a practical guide to state of the art printed antenna technology used for wireless systems Contributions from renowned global experts within both academia and industry enable the reader to design printed antennas and associated technologies and offer valuable insights into important breakthroughs in these areas Divided into 3 sections

covering fundamental wideband printed radiating elements for wireless systems small printed antennas for wireless systems and advanced concepts and applications in wireless systems Provides experimental data and applies theoretical models to present design performance trends and to give the reader an in depth coverage of the area Presents summaries of different approaches used in solving wireless systems such as WPAN wireless personal area network and MIMO multi input multi output offering the reader an overall perspective of the pros and cons of each Focuses on practical design examples and real world solutions Printed Antennas for Wireless Communications offers an excellent insight on printed antennas from the theoretical to the practical hence it will appeal to practicing design engineers within commercial and governmental military organisations as well as postgraduate students and researchers in communications technology Electrical Experimenter, 1928

Wireless Communication in Underground Mines L. K. Bandyopadhyay, S. K. Chaulya, P. K. Mishra, 2009-08-29 Wireless communication has emerged as an independent discipline in the past decades Everything from cellular voice telephony to wireless data transmission using wireless sensor networks has profoundly impacted the safety production and productivity of industries and our lifestyle as well After a decade of exponential growth the wireless industry is one of the largest industries in the world Therefore it would be an injustice if the wireless communication is not explored for mining industry Underground mines which are characterized by their tough working conditions and hazardous environments require fool proof mine wide communication systems for smooth functioning of mine workings and ensuring better safety Proper and reliable communication systems not only save the machine breakdown time but also help in immediate passing of messages from the vicinity of underground working area to the surface for day to day normal mining operations as well as for speedy rescue operations in case of disaster Therefore a reliable and effective communication system is an essential requisite for safe working and maintaining requisite production and productivity of underground mines Most of the existing systems generally available in underground mines are based on line wired communication principle hence these are unable to withstand in the disaster conditions and difficult to deploy in inaccessible places Therefore wireless communication is an indispensable reliable and convenient system and essential in case of day to day normal duty or disaster situations Wireless World, 1928
