Christian Müller-Schloer, Theo Ungerer, Bernhard Bauer, 2004-02-12 Where is system architecture heading The special
interest group on Computer and Systems Architecture Fachausschuss Rechner und Systemarchitektur of the German
computer and information technology associations GI and ITG addressed this question and discussed it during two Future
Workshops in 2002 The result in a nutshell Everything will change but everything else will remain Future systems
technologies will build on a mature basis of silicon and IC technology on well
understood programming languages and software engineering techniques and on well established operating systems and
middleware concepts Newer and still exotic but exciting technologies like quantum computing and DNA processing are to be
watched closely but they will not be mainstream in the next decade Although there will be considerable progress in these
basic technologies is there any major trend which unifies these diverse developments There is a common denominator
according to the result of the two Future Workshops which marks a new quality The challenge for future systems technologies
lies in the mastering of complexity Rigid and inflexible systems built under a strict top down regime have reached the limits of
manageable complexity as has become obvious by the recent failure of several large scale projects Nature is the most
complex system we know and she has solved the problem somehow We just haven't understood exactly how nature does it
But it is clear that systems designed by nature like an anthill or a beehive or a swarm of birds or a city are different from
today's technical systems that have been designed by engineers and computer scientists *The Object Concept* Rick
Decker, Stuart Hirshfield, 1995 This book presents a complete lab based introduction to computer programming based on the
object oriented paradigm and the C programming language Paperbound Books in Print , 1992
