Vector calculus

In Section A.9 of Appendix A we review the algebra of vectors, and in Chapter 1 we considered how to transform one vector into another using a linear operator. In this chapter and the next we discuss the calculus of vectors, i.e. the differentiation and integration both of vectors describing particular bodies, such as the velocity of a particle, and of vector fields, in which a vector is defined as a function of the coordinates throughout some volume (one-, two- or three-dimensional). Since the aim of this chapter is to develop methods for handling multi-dimensional physical situations, we will assume throughout that the functions with which we have to deal have sufficiently amenable mathematical properties, in particular that they are continuous and differentiable.

2.1 Differentiation of vectors

Let us consider a vector a that is a function of a scalar variable at By this we mean that with each value of u we associate a vector $\mathbf{a}(u)$. For example, in Cartesian coordinates $\mathbf{a}(u) = a_{x}(u)\mathbf{i} + a_{y}(u)\mathbf{i} + a_{x}(u)\mathbf{k}$, where $a_{y}(u)$, $a_{y}(u)$ and $a_{x}(u)$ are scalar functions of uand are the components of the vector a(u) in the x-, y- and z-directions respectively. We note that if a(a) is continuous at some point a = a n then this implies that each of the Cartesian components $a_{x}(\psi)$, $a_{y}(\psi)$ and $a_{y}(\psi)$ is also continuous there. Let us consider the derivative of the vector function a(a) with respect to a. The derivative of a vector function is defined in a similar manner to the ordinary derivative of a scalar function f'(x). The small change in the vector $\mathbf{a}(y)$ resulting from a small change the value of u is given by u) = a(u) (see Figure 2.1). The derivative of a(u)a = a(a) +with respect to at is defined to be district other = Mirro and part the $-\omega = \omega(\omega)$ = (2.1)assuming that the limit exists, in which case as(a) is said to be differentiable at that point. Note that da/dy is also a vector, which is not, in general, parallel to a(u). In Cartesian coordinates, the derivative of the vector $\mathbf{a}(a) = aa \mathbf{i} + av \mathbf{j} + aa \mathbf{k}$ is given by of the same after and other

du = das du i + das du j + das du j + das

Perhaps the simplest application of the above is to finding the velocity and acceleration of a particle in classical mechanics. If the time-dependent position vector of the particle with respect to the origin in Cartesian coordinates is given by $\mathbf{r}(t^*) = x(t^*)\mathbf{i} + y(t^*)\mathbf{j} + z(t^*)\mathbf{k}$
