

COMPARISON OF EVOLUTION MECHANISMS: SUMMARY

Lamarck's Hypothesis: The Inheritance of Acquired Characteristics

1. A changing environment creates a need for certain features to be developed in order to survive.*
2. "Acquired Characteristics": Through use and/or non-use, those features needed for survival are developed in each individual.
3. Inheritance: Those characteristics developed ("acquired") by individuals are somehow passed on to their offspring, who can continue that development...
4. New Species: Eventually, over many generations, enough differences have developed that we can say we have a new species.

Darwin's Hypothesis: Natural Selection

1. Overproduction: More offspring produced than will ultimately survive and reproduce.
2. Variation: Inheritable features vary from individual to individual.
3. Change in environment: Changes in climate, topography, food supply, predators, etc.
4. "Struggle for existence": Mainly competition within the species, for food, habitat, survival from being eaten.
5. "Survival of the fit" (not necessarily the strongest): Those with more adaptive traits tend to survive longer and/or produce the most offspring; these are the "naturally selected".
6. Inheritance of "selected" features: Traits involved are already inheritable, but may involve new combinations.
7. New Species, better adapted to the new environment: When the collective traits of the population differ significantly from the earlier population, and can no longer reproduce with the earlier population.

### QUICK COMPARISON

| <u>LAMARCK</u>                                                                         | <u>DARWIN</u>                                                                                                   |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1. Environment changes, thus creating a "need" to change.                              | 1. Variations of inheritable features which already normally exist.                                             |
| 2. Development of new features, "in order to survive,"* or "so that one can survive,"* | 2. Environment "screens out" (or SELECTS) features contributing to survival, and tends to eliminate the others. |
| 3. Newly acquired traits somehow get passed down to offspring.                         | 3. Those with traits which help survival tend to survive and have more offspring, who inherit those traits.     |
| 4. New Species, eventually.                                                            | 4. New Species, eventually.                                                                                     |

\* Note the Anthropomorphic wording here ("something non-human having human motivations or attributes"). This could also be referred to as the "Mickey Mouse" syndrome. Be sure to avoid this kind of wording or implication in any explanations of Natural Selection.

~~~~~

COMMON MISCONCEPTIONS TO AVOID

1. Only groups of organisms can evolve (populations or species); individuals never evolve.
2. Adaptations, in the evolutionary sense, is properly used in class and text, can only "develop" as characteristics of a species, generally over a long period of time, involving many generations; those must not be confused with the "adjustments" an individual might make, consciously or otherwise, enabling it to survive better (such as "developing resistance to a disease" or "adapting to higher altitudes", etc.).

Evolution Jonathan Bard, 2021-12-30 Evolution is the single unifying principle of biology and core to everything in the life sciences More than a century of work by scientists from across the biological spectrum has produced a detailed history of life across the phyla and explained the mechanisms by which new species form This textbook covers both this history and the mechanisms of speciation it also aims to provide students with the background needed to read the research literature on evolution Students will therefore learn about cladistics molecular phylogenies the molecular genetical basis of evolutionary change including the important role of protein networks symbionts and holobionts together with the core principles of developmental biology The book also includes introductory appendices that provide background knowledge on for example the diversity of life today fossils the geology of Earth and the history of evolutionary thought Key Features Summarizes the origins of life and the evolution of the eukaryotic cell and of Urbilateria the last common ancestor of invertebrates and vertebrates Reviews the history of life across the phyla based on the fossil record and computational phylogenetics Explains evo devo and the generation of anatomical novelties Illustrates the roles of small populations genetic drift mutation and selection in speciation Documents human evolution using the fossil record and evidence of dispersal across the world leading to the emergence of modern humans

Principles of Evolution: Systems, Species, and the History of Life Jonathan Bard, 2016-09-12 Principles of Evolution considers evolution in the context of systems biology a contemporary approach for handling biological complexity Evolution needs this systems perspective for three reasons First most activity in living organisms is driven by complex networks of proteins and this has direct implications particularly for understanding evo devo and for seeing how variation is initiated Second it provides the natural language for discussing phylogenetic trees Third evolutionary change involves events at levels ranging from the genome to the ecosystem and systems biology provides a context for integrating material of this complexity Understanding evolution means on the one hand describing the history of life and on the other making sense of the principles that drove that history The solution adopted here is to make the science of evolution the primary focus of the book and place the various parts of the history of life in the context of the research that unpicks it This means that the history is widely distributed across the text This concise textbook assumes that the reader has a fair amount of biological knowledge and gives equal weight to all the major themes of evolution the fossil record phylogenetics evo devo and speciation Principles of Evolution will

therefore be an interesting and thought provoking read for honors level undergraduates and graduates working in the biological sciences

Unity and Disunity in Evolutionary Biology Richard G. Delisle, Maurizio Esposito, David Ceccarelli, 2024-09-02 It is not uncommon to see in major areas of research concerned with science that historical studies are accompanied by the rise of complementary or contradictory historiographies With time it seems scholars discover new approaches to study topics thus questioning old concepts traditions periodizations and historical labels Apparently this has not been the case in evolutionary thought In that area the main historiographic labels such as Darwinian Revolution Eclipse of Darwinism and Modern Synthesis have been in place and largely uncontested for about 50 years Such labels seem to work as irrefutable and often hidden premises of many historical reconstructions philosophical analyses and scientific conceptualizations This volume aims to move beyond this state of affair opening new thinking avenues by revisiting the traditional historiography and laying the groundwork for establishing a new historiography that considers the intertwined threads that compose evolutionary biology Notably evolutionary studies seem to have been marked by the tension between unification attempts and the proliferation of approaches methodologies and styles of thinking As the contributors to this volume illustrate research traditions branched off throughout the history of evolutionary thought before and after Charles Darwin The resulting complexity challenges traditional thinking categories throwing a somewhat different light on a more recent label like the Extended Evolutionary Synthesis More than 40 years after the now classic *The Evolutionary Synthesis Perspectives on the Unification of Biology* 1980 edited by Ernst Mayr and William Provine the contributors to this volume aim to reevaluate where evolutionary biology stands today

The Evolving God J. David Pleins, 2013-06-06 In focusing on the story of Darwin's religious doubts scholars too often overlook Darwin's positive contribution to the study of religion J David Pleins traces Darwin's journey in five steps He begins with Darwin's global voyage where his encounter with religious and cultural diversity transformed his understanding of religion Surprisingly Darwin wrestles with serious theological questions even as he uncovers the evolutionary layers of religion from savage roots Next we follow Darwin as his doubts about traditional biblical religion take root affecting his career choice and marriage to Emma Wedgwood Pleins then examines Darwin's secret notebooks as he searches for a materialist theory of religion Again other surprises loom as Darwin's reading of Comte's three stages of religion's development actually predate his reading of Malthus Pleins explores how Darwin applied his discovery to the realm of ethics by formulating an evolutionary view of the Golden Rule in his Descent of Man Finally he considers Darwin's later reflections on the religion question as he wrestled with whether his views led to atheism agnosticism or a new kind of theism The Evolving God concludes by looking at some of the current religious debates surrounding Darwin and suggests the need for a deeper appreciation for Darwin as a religious thinker Though he grew skeptical of traditional Christian dogma Darwin made key discoveries concerning the role and function of religion as a natural evolutionary phenomenon
