The Earth's Ecosystems

SECTION 1: LAND BIOMES		
Main Ideas		There are eight kinds of land biomes: temperate deciduous forests, coniferous forests, tropical rain forests, temperate grasslands, savannas, deserts, polar tundra, and alpine tundra. Each land biome contains organisms that are well-suited for the abiotic and biotic elements that are present.
LAND BIOMES	Biome	A large region characterized by a specific type of climate and certain types of plant and animal communities. A biome is made up of many related ecosystems.
	Forest biomes	There are three kinds of forest biomes: temperate deciduous, coniferous, and tropical rain forests. Temperate deciduous forests have trees whose leaves will turn colors and fall off between autumn and winter. Coniferous forests consist mainly of conifers, or evergreens. These have special needle-shaped leaves that stay green all year long and do not fall off all at once. Tropical rain forests have more variety of plants and animals than anywhere else on Earth. Warm temperatures and high rainfall amounts allow a lot of plant growth and densely-growing tall trees.
	Grasslands	These are biomes made up mainly of grasses, small flowering plants, and a few trees. The two main kinds of grasslands are temperate grasslands and savannas. In temperate grasslands, the summers are warm and the winters are cold. The soil is very rich in nutrients. Savannas have a lot of rainfall during some seasons and very little in others.
	Savanna	A grassland that often has scattered trees and that is found in tropical and subtropical areas where seasonal rains, fires, and drought happen.
	Desert	A region that has little or no plant life, long periods without rain, and extreme temperatures: usually found in hot climates. Many of the organisms living in deserts have special features that allow them to survive in the dry climate.
	Tundra	A treeless plain found in the Arctic, in the Antarctic, or on the tops of mountains that is characterized by very low winter temperatures, short, cool summers, and very little rainfall. There are two types: polar and alpine.
	Polar tundra	Found near the North and South Poles, the layer of soil below the surface, called permafrost, stays frozen all year long.
	Alpine tundra	Similar to polar tundra but found at the tops of mountains above the tree lines. It receives a lot of sunlight and a moderate amount of rainfall.
