### ANSWER KEY

1. Describe how each of the following factors would affect the rate of a chemical reaction in terms of "particle collisions" in your response.
  - a. Temperature decreases *If temperature decreases, the particles move slower and there will be less reactant particle collisions AND a smaller percentage of particles have enough energy to produce a reaction. The reaction rate will therefore decrease.*
  - b. Addition of iodide ions,  $I^-$ , as a catalyst *The presence of the catalyst lowers the activation energy of the reaction taking place. This means that a larger percentage of particles have enough energy to produce a reaction. The reaction rate will therefore increase.*
  - c. Increased reactant concentration *With more reactant particles in the same volume, there are more collisions between those particles. This means the reaction rate will increase.*
  - d. Crushing a solid into a powder (with larger surface area) *As a powder, there is more surface area for collisions to take place. This means there will be more collisions and therefore a faster reaction rate.*
2. The reaction progress diagram shows the energy changes that take place when nitrogen dioxide gas reacts with carbon monoxide gas to form carbon dioxide gas and nitrogen gas.
