

PHOTOLYSE STEMS AND LEAVES

Plants have structures that allow them to absorb light energy and convert it into glucose and oxygen.

Light energy from the sun is used to make glucose.

There are two main types of photosynthesis:

- C₃ pathway (most common)
- C₄ pathway (more efficient)
- CAM pathway (specialised for arid conditions)

Photosynthesis occurs in the chloroplasts of plant cells.

Chloroplasts are organelles found in plant cells that contain chlorophyll, the green pigment that captures light energy. They are the site of photosynthesis.

Water and CO₂

Plants take up water from the soil through their roots. Water is then transported through the xylem to the leaves. Carbon dioxide (CO₂) enters the leaves through small openings called stomata. Inside the leaf, CO₂ is used in the C₃ pathway of photosynthesis to produce glucose and oxygen.
