

Signal Transduction Pathways

Why? What happens inside of a cell when a signal has been received?

When cells release signal molecules (ligands) to send a message, and the message is received, a whole host of events take place inside the cell. The ultimate goal is a response—a gene is turned on, a protein is manufactured, an enzyme is activated, the cell divides or dies, etc. There are many responses that could occur, but the pathways to those responses are very similar.

Signals and Signal Transduction Pathways in Plants Klaus Palme, 2012-12-06 Plants offer exciting opportunities to understand major biological questions i.e. the regulation of development and morphogenesis. How are changes of the environment, developmental cues and other signals perceived and transduced in physiological responses? What are the elements of plant signalling pathways and what is their organization? The panoply of molecular tools and techniques as well as the blossoming field of plant genetics are providing an exciting ground for major breakthroughs in unravelling the fundamental mechanisms of plant signalling. The present book establishes a state of the art framework spanning the wide spectrum of perception, signal transduction events and transport processes including cell proliferation and cell cycle regulation, embryogenesis and flowering. Moreover, the volume emphasizes the role of the major plant signalling substances known to date: the phytohormones and more recently studied substances and summarizes what we know on their molecular mechanisms of action. The book emphasizes how the use of molecular technology has made plant signalling processes accessible to experimental test.

The key role of ubiquitination and sumoylation in signaling and cancer Hui-Kuan Lin, Wenyi Wei, Ubiquitination and Sumoylation are two important posttranslational modifications that play pivotal roles in a variety of biological functions Although Ubiquitination is traditionally viewed as a critical mark targeting proteins for proteasome dependent degradation recent studies reveal that it also plays nonproteolytic functions In contrast Sumoylation is long thought not to target proteins for degradation accumulating evidence suggests that it can serve a priming effect prerequisite for ubiquitination thereby inducing protein ubiquitination and degradation Thus there is an important cross talk between sumoylation and ubiquitination in determining protein fate Deregulation in these two marks may cause aberrant activity of proteins and in turn contributes to cancer development In this Research Topic we accept review articles perspectives research articles covering any one or both of these two posttranslational modifications in regulating diverse signal transduction pathways and providing the novel insights in unraveling the puzzle as to how they may regulate cancer progression and metastasis
