Three-Dimensional Velocity and Vorticity Measuring and Image Analysis Techniques Th. Dracos, 2013-06-29 The contents of this volume reflect to a large extent the efforts made by a group of Institutes at the ETH Z rich to develop new techniques for measurements of flows in fluids in the last decade The motivation came from the study of transport and mixing processes in natural and industrial systems One of the characteristic properties of turbulence is its high mixing efficiency The techniques developed are therefore suitable although not exclusively for turbulence measurements They can be subdivided into point measurements and field measurements The aim of the point measurements developed is to determine the three components of the velocity and all their first derivatives with good temporal resolution and accuracy in turbulent flows The old and well established method of hot wire anemometry was used for this purpose One of the main achievements in this context is the construction of miniature multi wire probes This technique was introduced to the Institute of Hydromechanics and Water Resources Management of ETH Z rich by Profs A Tsinober and E Kit from Tel Aviv University This was made possible by the generous financial support by ETH for which I would like to express my gratitude on this occasion In addition Dr F E

Sensors and Measurement Techniques for Chemical Gas Lasers

Mainuddin Gaurav Singhal, 2014-09-27 Sensing and Measurement is the key technology area in the development of these lasers. Advanced sensing and measurement technologies are required to acquire, analyze and transform data into information that is useful to enhance the performance and capabilities of these laser systems. The goal of this book is therefore to enable scientists and technologists working in this rather complex area of chemical lasers to achieve the best technical performances. Till now such topics have been covered scantily in open literature and that too in the research papers only.

CO₂ Laser Cutting John Powell, 2012-12-06

The laser has given manufacturing industry a new tool. When the laser beam is focused it can generate one of the world's most intense energy sources more intense than flames and arcs though similar to an electron beam. In fact the intensity is such that it can vaporise most known materials. The laser material processing industry has been growing swiftly as the quality, speed and new manufacturing possibilities become better understood. In the fore of these new technologies is the process of laser cutting. Laser cutting leads because it is a direct process, substitution and the laser can usually do the job with greater flexibility, speed and quality than its competitors. However to achieve these high speeds with high quality considerable know-how and experience is required. This information is usually carefully guarded by the businesses concerned and has to be gained by hard experience and technical understanding. Yet in this book John Powell explains in lucid and almost non-technical language many of these process wrinkles concerning alignment, cornering, pulsing, water jets, material properties, cutting speeds as well as tricks with surface coating and much much more. It is a book which managers and technicians in laser job shops and laser processing facilities would be foolish not to read.
