Lipton, 2010-04-28 BSD All magnetic resonance technologists and all radiologists who work with magnetic resonance MR technology can be divided into two subgroups 1 those who understand the underlying physics principles and how to apply them and 2 those who do not For so many patients and for so many diagnostic considerations the difference between membership in these two groups is minimal One can easily diagnose a vestibular schwannoma and accurately differentiate it from a cerebellopontine angle meningioma without being that well versed with many of the concepts underlying the creation of the MR images on which these tumors are depicted One by rote can generate images of the pelvis that are quite diagnostic and aesthetically pleasing without really understanding the intricate interrelationships between the varying imaging parameters used in the generation of the obtained image contrast There are certain situations however for which a more in depth understanding is required For example Seeing tissue signal disappear on a short T1 inversion recovery sequence yet recognizing that it does not have to originate from fat but may come from methemoglobin or some other short T1 tissue may prove clinically vital for arriving at the correct diagnosis For such circumstances understanding the underlying principles that

govern the creation of the image and the contrast contained therein is critical and sets one apart and distinctly ahead of the competition who cannot make this claim Rad Tech's Guide to MRI William H.
