Spectral Geometry of Graphs Pavel Kurasov,2023-11-07 This open access book gives a systematic introduction into the spectral theory of differential operators on metric graphs Main focus is on the fundamental relations between the spectrum and the geometry of the underlying graph The book has two central themes the trace formula and inverse problems The trace formula is relating the spectrum to the set of periodic orbits and is comparable to the celebrated Selberg and Chazarain Duistermaat Guillemin Melrose trace formulas Unexpectedly this formula allows one to construct non trivial crystalline measures and Fourier quasicrystals solving one of the long standing problems in Fourier analysis The remarkable story of this mathematical odyssey is presented in the first part of the book To solve the inverse problem for Schrödinger operators on metric graphs the magnetic boundary control method is introduced Spectral data depending on the magnetic flux allow one to solve the inverse problem in full generality this means to reconstruct not only the potential on a given graph but also the underlying graph itself and the vertex conditions The book provides an excellent example of recent studies where the interplay between different fields like operator theory algebraic geometry and number theory leads to unexpected and sound mathematical results The book is thought as a graduate course book where every chapter is suitable for a separate lecture and includes problems for home studies Numerous illuminating examples make it easier to understand new concepts and develop the necessary intuition for further studies

Topologically Ordered

Zigzag Nanoribbon: E/2 Fractionally Charged Anyons And Spin-charge Separation Eric Sung Ryul Yang,2023-03-21 This is the first graduate level textbook of topologically ordered phases with emphasis on graphene zigzag nanoribbons It also explains common properties of several other topologically ordered phases as well as the e/2 fractional charge quantization and spin charge separation of an electron **Professional Paper** ,1947 **Low Dimensional Topology and Number Theory** Masanori Morishita,Hiroaki Nakamura,Jun Ueki,2025-03-02 This book is the result of research initiatives formed during the workshop Low Dimensional Topology and Number Theory XIII at Kyushu University in 2022 It is also

dedicated to the memory of Professor Toshie Takata who has been a main figure of the session chairs for the series of annual workshops since 2009. The activity was aimed at understanding and deepening recent developments of lively and fruitful interactions between low dimensional topology and number theory over the past decades. In this volume of proceedings the reader will find research papers as well as survey articles including open problems at the interface between classical and quantum topology and algebraic and analytic number theory written by leading experts and active researchers in the respective fields. Topics include among others the strong slope conjecture, Kashiwara–Vergne Lie algebra braids and fibered double branched covers of 3-manifolds, Temperley–Lieb Jones category and conformal blocks, WRT invariants and false theta functions, the colored Jones polynomial of the figure eight knot, potential functions and A-polynomials, 1-adic Galois polylogarithms, Dijkgraaf–Witten invariants in Bloch groups, analogies between knots and primes in arithmetic topology, normalized Jones polynomials for rational links, Iwasawa main conjecture, Weber's class number problem. The book provides a valuable resource for researchers and graduate students interested in topics related to both low dimensional topology and number theory.
