Valency M.F. O'Dwyer, J.E. Kent, R.D. Brown, 2012-12-06 This book was written after one of us published two editions of a smaller book Atomic Structure and Valency by R D Brown 1961 and 1966 and from the experiences of all three of us teaching a first year university course in valency at Monash University Our object has been to give enough of an historical introduction to quantum mechanics to enable a student to grasp the fundamental ideas without being subjected to much mathematical formalism We have also tried to avoid making erroneous statements in the interest of simplicity e.g. the widespread tendency to ignore the difference between $2p_x$, $2p_y$, $2p_z$ because these lead to irritation and confusion of the better students when they proceed to further studies of chemical quantum mechanics The topics we have chosen to expand upon i.e. energy levels of electrons in atoms energetic considerations of bonding in diatomic molecules and packing of ions in the simplest solid state structures we believe form a good basis for students to progress to more complicated systems in a qualitative way Both space and the intended level of the book have necessitated that the experimental section on spectroscopic and diffraction methods be very introductory Again we believe that it is essential for a student to have some acquaintance with this if the whole subject is to have a firm basis

A Pictorial Approach to Molecular Bonding John G. Verkade, 2012-12-06 With the development of accurate molecular calculations in recent years useful

predictions of molecular electronic properties are currently being made. It is therefore becoming increasingly important for the non-theoretically oriented chemist to appreciate the underlying principles governing molecular orbital formation and to distinguish them from the quantitative details associated with particular molecules. It seems highly desirable then that the non-theoretician be able to deduce results of general validity without esoteric mathematics. In this context pictorial reasoning is particularly useful. Such an approach is virtually indispensable if bonding concepts are to be taught to chemistry students early in their careers. Undergraduate chemistry majors typically find it difficult to formulate molecular orbital schemes especially delocalized ones for molecules more complicated than diatomics. The major reason for this regrettable situation is the general impracticability of teaching group theory before students take organic and inorganic courses wherein the applications of these concepts are most beneficial. Consequently many students graduate with the misconception that the ground rules governing bonding in molecules such as NH_3 are somehow different from those which apply to aromatic systems such as C_6H_6 . Conversely seniors and many graduate students are usually only vaguely if at all aware that sigma bonding like extended pi bonding can profitably be described in a delocalized manner when discussing the UV photoelectron spectrum of CH_4 for example.
