**C-REACTIVE PROTEIN (CRP)**

Investigation	Result	Reference Value	Unit
<b>Sample Type</b>	Serum (2ml)	<b>TAT : 8 hrs (Normal: 8 - 10 hrs)</b>	
<b>C-REACTIVE PROTEIN (CRP)</b> <small>IMMUNOTURBIDIMETRY</small>	<b>3.50</b> Normal	0.00 - 5.00	mg/dL

**Interpretation:**

1. Measurement of CRP is useful for the detection and evaluation of infection, tissue injury, inflammatory disorders, and associated diseases.
2. High sensitivity CRP (hsCRP) measurements may be used as an independent risk marker for the identification of individuals at risk for future cardiovascular disease.
3. Increase in CRP values are non-Specific and should not be interpreted without a complete history.

**The level of CRP in the blood is normally low.****Increased CRP level:**

A high or increasing amount of CRP in the blood suggests the presence of inflammation but will not identify its location or the cause.

- Suspected bacterial infection — a high CRP level can provide confirmation that you have a serious bacterial infection.
- Chronic inflammatory disease — high levels of CRP suggest a flare-up if you have a chronic inflammatory disease or that treatment has not been effective.

The functions of CRP during the inflammatory state, however, have not been defined yet. *Davis's Comprehensive Manual of Laboratory and Diagnostic Tests with Nursing Implications* Anne Van Leeuwen, Mickey Bladh, 2023-04-04 The information nurses need when, where, and how they need it. Winyard, Derek A. Willoughby, 2008-02-03 Inflammation has been described as the basis of many pathologies of human disease. When one considers the updated signs of inflammation, they would be vasodilation, cell migration, and in the case of chronic inflammation, cell proliferation, often with an underlying autoimmune basis. Generally, inflammation may be divided into acute, chronic, and autoimmune, though the editors believe that most, if not all, chronic states are often the result of an autoimmune response to an endogenous antigen. Thus, a proper understanding of the inflammatory basis may provide clues to new therapeutic targets, not only in classical inflammatory diseases but atherosclerosis, cancer, and ischemic heart disease, as well. The lack of advances in classical inflammatory diseases such as rheumatoid arthritis may in part arise from a failure to classify the disease into different forms. That different forms exist is exemplified in patients with differing responses to existing anti-inflammatory drugs, ranging from nonresponders to very positive responders. For a particular nonsteroidal anti-inflammatory drug (NSAID), though researchers have progressively unraveled the mechanisms, the story is far from complete. It should also be noted that the inflammatory response is part of the innate immune response or, to use John Hunter's words in 1795, inflammation is a salutary response that may be applied in particular to the defensive response to invading micro-
