

AIR INDUCTION SYSTEM

● AIR VALVE

AIR VALVE

OPERATION

The air valve is a fast idle device operated by a bimetal and heat coil to increase engine rpm when the engine is cold.

When starting a cold engine, the gate valve is open allowing air from the air cleaner to bypass the throttle valve and flow directly through the air valve to the air intake chamber.

Thus, even though the throttle valve is in the closed position, intake air volume is increased and idle speed will be slightly faster than normal (fast idle). When the engine is started, current begins to flow to the heat coil. As the bimetal is heated, the gate valve will gradually close and engine rpm will decrease.

Once warmed up, the gate valve will be fully closed, preventing air flow, and idle speed will return to normal.
